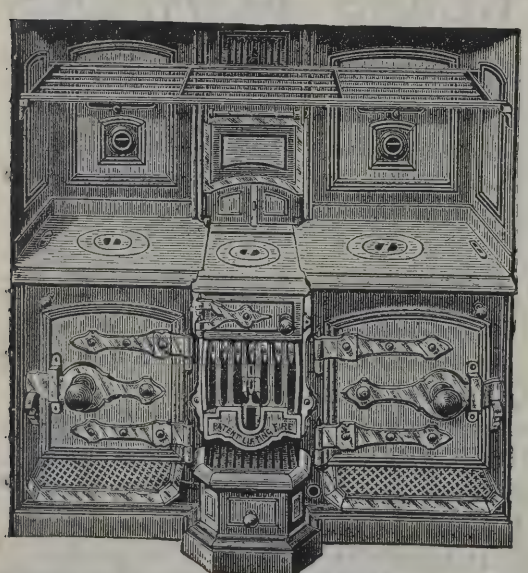
This seems to form a serious objection to the use of soluble silicates, either for stone preservation or stereochromic painting; and it is a difficulty which those who have worked upon soluble silicates have found very troublesome to remedy. The fact that silica combines with lime, sand and other substances used in the painting ground, is indisputable; but this very combination leaves behind that which in the presence of moisture has a destructive action on the ground which it is intended to preserve and on the colours applied to it. In painting a picture, especially one of large dimensions and in ornamental painting, the colours are often laid on in thick masses; but if these colours do not combine chemically with silica they will be only mechanically fixed to the wall by the silicate; and as this silicate, which was soluble before application, remains so afterwards, unless it form an insoluble compound with some other substance, the simple action of damp continued for some time will loosen and eventually remove the colours. Now, many of the pigments used in painting, such as ochres, umbers, certain reds and blacks, do not combine with silica; and as they are frequently used pure or nearly so in the glazing and finishing touches, on which the effect of a picture mainly depends, they cannot be permanently fixed, and such is proved to be the case by the experience of those who have given the subject patient and careful investigation. There are, doubtless, many silicious paintings which have stood for several years; there are also distemper paintings which have lasted for many more. In sheltered situations and in interiors it is quite possible that this may be the case; but even here repeated applications of silicious washes have been made at intervals, after the completion of the work, and such a practice is recommended for refixing particles of colour which may, after a time, have become loosened.

The above remarks are not intended to disparage Dr. Fuchs's discovery, which is, in truth, one of the most important to art ever made. To this modest and great man all who are interested in the advancement of art owe a deep debt of gratitude for his persevering labours, pursued for many years amidst much discouragement and many difficulties. Those who read his treatise on stereochromy cannot but feel delighted with the earnestness and singleness of purpose with which he has laboured to attain the high end which he set before him.



50 PER CENT. OF FUEL SAVED

BY USING

RUSSELL'S

PATENT

LIFTING FIRE COOKING RANGES.

THEY are the most perfect lifting Fire Ranges in the market. There are no working parts in the fire, consequently they cannot get out of order. They do away with the expense and annoyance of False-bottom Grates, and are so simple that a child can work them. Not only are they great economisers of fuel, but the kitchen is kept much cooler than with the ordinary Ranges.

Arrangements have been made with **Ironmongers** in nearly every town in the kingdom to stock these Ranges, and to supply drawings and prices on application.

Any of our Patent Ranges can be supplied through an **Ironmonger.**

ROBERT RUSSELL & SONS, PEEL FOUNDRY, DERBY.

He thus concludes the account of his investigations :—"But, before all, I thank God, who graciously allowed his weak and aged servant to finish the preceding investigations so far that others may build upon the foundation that I have laid." He evidently saw that much remained to be done to perfect the process which he had originated.

This paper has been written to lay before those who feel interested in the matter certain facts which are the result of some years' experience, and also to induce those who are engaged in art pursuits to turn their attention seriously to a process which, by rendering their works lasting and in all respects better suited to supply an increasing want, will make their profession more remunerative and their exertions more conducive to the happiness and improvement of their fellow-men.

If artificial ultramarine be mixed with a soluble silicate—for example, silicate of potash—and be laid on a properly prepared ground, it will become so firmly fixed that no amount of washing nor the slow action of moisture will remove it or affect its brilliancy. If, however, reds, such as vermilion, red ochre, some of the oxides of iron, or browns, such as umber or siena, be similarly treated, they will not endure the same test. Why is this? Ultramarine contains 37 per cent. of silica and 27 per cent. of alumina—two substances with which a soluble silicate readily unites. It is well known in laboratories that test tubes and other glass vessels which have contained soluble silicates become corroded, and that it is impossible to separate the silicious crust from the glass. There is in all soluble silicates, unless specially prepared, an excess of alkali; this, no doubt, acts on the glass vessel, and, by partly dissolving it, facilitates the union of the silica deposited from the solution with the softened particles of its surface. In time the alkali becomes saturated with the silica of the glass vessel, and when this saturated silicate is dry it is much less soluble that when excess of alkali was present. Alumina readily unites with silica in the soluble form, whether the alumina be in solution or not, though in the latter case the action is much slower. It also takes into combination with it a certain quantity of the alkali, forming a compound analogous to felspar. It is not, therefore, difficult to account for the stability of the product resulting from the mixture of ultramarine with a soluble silicate. This fact points out the direction in which investigations should be made for the improvement of silicious painting. It will be well to consider briefly, first, the method of preparing colour; then the preparation of the painting ground; afterwards the solution to be used as the painting vehicle; and, finally, the method of manipulation and the permanent fixing of the picture. Alumina forms very stable natural compounds with silicate, potash, soda and lime. Felspar, which enters largely into the composition of granite, consists mainly of silica, alumina and potash. Porphyry, red and green, is a very enduring substance, and is also a species of felspar. Basalt, labradorite and albite are formed of silica, lime, potash and alumina variously combined. Labradorite contains lime and albite soda in union with silica and alumina. All these minerals are hard and enduring. It is quite possible to produce artificially substances approaching their composition which will resist the action of damp and other destructive agents to which paintings are always exposed. Judging from the behaviour of ultramarine, if the colours employed contain silica and alumina, they should adhere as firmly to the surface on which they are placed; and such really is the case. If alumina be fused with potash, aluminate of potash is formed containing a large quantity of alumina. If this be dissolved, so as to form a solution of sp. gr. 1·12, it may be kept for several days; if a stronger solution be made, it begins very soon to deposit alumina. The solution sp. gr. 1·12 mixed with silicate of potash sp. gr. 1·2 will remain liquid for twenty-four hours, or perhaps a little longer; after that it will gelatinise slowly. If while in the liquid state colours are saturated with this solution, and are allowed to dry, their particles will be very intimately mixed with silica and alumina chemically combined with potash. After drying for some time at a gentle heat the operation may be repeated, and any quantity of the silicate of alumina and potash may be thus mixed with the colours. Care should be taken that they be finely powdered between each application, and they should be stirred up so as to keep them from caking at the bottom of the vessel, which hinders the perfect contact of the particles with the liquid. After careful drying for some days they may be well washed for the removal of any uncombined potash. The admixture of silica and alumina does not interfere with the brilliancy or depth of the colours. This method may be used for all colours, but it is better suited for such as ochres, umbers, siennas, &c., which are changed in tint by exposure to a high temperature. The different pigments made from metallic oxides, such as iron reds, cobalt blue, chromic green, &c., are better prepared by precipitation, as silicates and aluminates, by the addition of the mixed silicate and aluminate of potash to any of the solutions of their oxides in mineral acids. The precipitate should be

well washed, dried, ignited and ground. Colours made by the same method as those used in painting on porcelain (*i.e.* by fusion), where the colour is not affected by intense heat, answer perfectly well, as they contain silica to which alumina can be added in the process of manufacture. Excellent reds, greens, browns and some yellows can be procured in this way. The object of using colours which contain silica and alumina has already been stated to be the formation of coherent insoluble compounds with the vehicle used in painting.

REGISTRATION OF PLUMBERS.

AT the meeting of the quarterly court of the Plumbers' Company, at the Guildhall, on the 29th ult., Mr. W. H. Bishop, re-elected master, Mr. Charles Hudson, re-elected warden, and Sir Philip Magnus, elected renter warden, were severally sworn into their respective offices for the ensuing year. Reports were made to the court with reference to the prizes and certificates of merit awarded by the company to the successful students in the plumbing classes held in the chief cities and towns of Great Britain and Ireland, and with reference to the examinations of candidates for registration, and the examinations in the preliminary course of the company's graded syllabus of instruction for plumbers.

The district council for South Hants and the Isle of Wight held a meeting recently at the Municipal Offices, Southampton, when there was a good attendance. The registration committee acknowledged the receipt of the report of the board of examiners on the result of the last examinations held in Southampton. The committee reported that they had considered the draft Bill for the National Registration of Plumbers forwarded to them by the solicitors to the Worshipful Company of Plumbers, and that they had decided to request the Council to support the Bill.

At the last meeting of the district council for Glasgow and the West of Scotland, Mr. W. A. Rattray, plumber, afterwards Mr. David Thomson, architect, occupied the chair. The examiners submitted their report of the examination for applicants for registration, which was held in Messrs. Wallace & Connell's workshop on September 19. It was reported that bill, circular and prospectus had been issued in connection with the opening of the plumbers' class in the Technical College on the 7th inst., when the prizes for last session will be distributed in presence of the students, the governors of the college, and the district council. Further arrangements were made in connection with the resumption of the Greenock class.

AN ELECTRIC RAILWAY.

THE World's Fair Grounds at Chicago were to be opened to visitors on October 7, for the inspection of the work. For their accommodation there is being constructed an electric railway of ingenious and novel character, having a capacity to carry 30,000 passengers an hour with comfort and safety. This railway will differ from ordinary railways in that the passengers are transported on a movable sidewalk instead of box cars of the ordinary type. The sidewalk is to be constructed on an elevated structure 25 feet high and 900 feet long, in the form of an ellipse, and is to consist of seventy-five cars, each 12 feet long, connected together, making one solid train. There are to be constructed two parallel sidewalks, one running at the rate of two miles an hour, the other at four, both walks moving in the same direction. The passengers can step from the stationary walk to the one which moves at the rate of two miles an hour, and if it is desired to move at a greater speed, they can step from this walk to the one running at four miles per hour. The passengers can safely walk upon either of the movable sidewalks while in motion if desired. The structure will be illuminated at night by a number of incandescent lights, and as the grounds are to be illuminated with arc lights a satisfactory view thereof can be obtained during the evening as well as during the day. As the car-platform or sidewalk is arranged, it is perfectly level with the stationary walk, allowing the trolley wire to be placed beneath the surface of the platform, and the current taken therefrom by means of small trolleys attached beneath the car floors. The operation of this train of cars will be arranged in a novel manner, doing away with the use of motor-men, the entire train being controlled and operated by one man. There will be constructed at a central point, at one side of the track, a controlling station, where an attendant will have the train under perfect control. As an additional safeguard, push-buttons will be arranged at twelve points along the line of track, which will be connected with an electric bell and the circuit-breaker in the controlling-station, and, in case of accident to any of the mechanism of the

IRON AND STEEL INDUSTRY IN INDIA.

At the last Indian Industrial Conference, held at Poona last month, a paper was read on the iron and steel industry of London by Dr. Dhanakoti Raju, of Madras and Mysore. Official records, he said, showed the total value of iron imported into India from foreign countries by private merchants alone, between 1868 and 1880, amounted to nearly 16 crores of rupees. The Government of India had, in a resolution of August 1882, said:—"It may be accepted as proved that India possesses the means of supplying all her wants in respect of cast-iron, wrought-iron and steel, and that such supply could be produced remuneratively on a strictly commercial basis." It had also been stated that India would ultimately become one of the largest sources whence Sheffield would draw her supplies of raw materials, and an eminent English manufacturer observed that, on the whole, the steel of India was the best he had met with. Dr. Dhanakoti hoped that the development of the iron ores of India might be left to private enterprise. Although the old native methods of manufacturing iron and steel were able to produce excellent results in former days, both with regard to the superior quality of the article turned out and the general profit of the business, they had now, within the last thirty or forty years, become quite unable to compete with the introduction of foreign iron and steel, the manufacturing cost of which had been greatly reduced by the introduction within the last fifty years of improved processes and appliances of machinery. The native system involved a ruinous waste of labour, time and materials compared with the modern European systems of manufacturing iron and steel. From the peculiarly favourable conditions and facilities that exist in some parts of India for manufacturing iron and steel of the finest quality in the world, it was not too much to say that if only some intelligent and enterprising men of moderate capital would earnestly and energetically work in the highly promising but greatly neglected field, it would soon lead to most important and lasting results. Dr. Dhanakoti spoke of moderate capital advisedly, for with such favourable conditions the undertaking was rendered comparatively simple and easy, and one which would involve very moderate expense. After a careful study of the question, he was convinced that, instead of adopting wholesale any of the modern European processes, it would be most advantageous to adopt the native system (with some modifications) of manufacturing iron and steel—the system which has been in existence in some parts of the country from the remotest antiquity, and which had produced the most admirable results till a very short time ago. That system was the simplest, the safest, and the best suited to the peculiar conditions of this country.

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Cassell, Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.*]

Applications for Patents.

15984. Mary Anne Greene, for "Improvements in windows."

16005. George Pitt, for "An improved mode of constructing flues for brick, terra-cotta and other kilns."

16020. Joseph Trantom, for "Improvements in or relating to check-tills for use in shops and other places."

16105. Joseph Harper Kearton, for "An improved sash-fastener."

16154. Charles Henry Wilkinson, for "Improvements in window-blinds."

16200. Harold Ratcliffe, for "Improved decorative or ornamental wallings, ceilings and the like."

16201. Harold Ratcliffe, for "Improved fancy or ornamental bricks, tiles or slabs."

16275. Edmund Taylor and Harold Cliff, for "Door-stops or devices for holding doors open."

16309. Francis Weldon, for "An improved device for connecting the parts of scaffolding and other like structures."

16340. James Strick, for "A pad for use in connection with staples and similar holders."

BRITANNIA TIN AND COPPER WORKS.

TO ARCHITECTS AND BUILDERS.

Fountain Street, Bury, and Shiffnall Street, Bolton:
February 13, 1891.

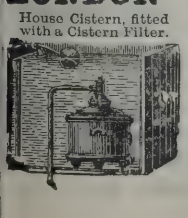
Gentlemen,—We have pleasure in announcing that we have opened extensive Show Rooms at 117 QUEEN VICTORIA STREET, LONDON (opposite Civil Service Stores).

We have been very successful in Lighting and Ventilating Public Buildings in all parts of the Country.

We have a large stock of Sunlights, Turrets, Exhaust Roof Outlets, Tobin's Tubes, Air Grids, &c., &c., at our Show Rooms.

We feel confident that our **DESIGNS**, as well as our system of Lighting and Ventilating will commend themselves to all who are interested in having BRILLIANTLY LIGHTED and WELL-VENTILATED ROOMS.

A visit to our Show Rooms will be esteemed a favour. If inconvenient to call, send for one of our Illustrated Catalogues, inspect our Designs, and read our Testimonials.



Trusting to receive your favours, which shall have our prompt attention,

We remain, Gentlemen, yours obediently, **J. H. PICKUP & CO.**

NO FAMILIES WHO VALUE THEIR HEALTH SHOULD BE WITHOUT ONE OF THE

LONDON AND GENERAL WATER PURIFYING COMPANY'S, LIMITED,

House Cistern, fitted with a Cistern Filter.

PATENT CISTERN FILTERS, Charged Solely with Animal Charcoal. Requiring, when once fixed, NO attention whatever, and superior to any others. *Vide* Professor Frankland's Reports to the Registrar-General, July 1866; November 1867; and May 1870, The *Lancet*, January 12, 1867.

Also, Testimonials from Dr. Hassall, September 23, 1863; the late Dr. Letheby, February 15, 1865, and December 1872.

Price, £1 10s. and upwards. Portable Filters on this System, £1 5s. to £3.

Patronised and used by Her Majesty the Queen at Osborne, by H.R.H. the Prince of Wales at Sandringham, by H.R.H. the Duke of Edinburgh at Eastwell, by H.R.H. the Duke of Connaught at Bagshot Park, by H.R.H. the Duke of Cambridge, the *élite* of the Medical Profession, and at the London, Middlesex, St. George's, St. Mary's, Consumption, Fever, and German Hospitals, and various Lunatic Asylums, Institutions, Breweries, &c., and at all the Schools established by the School Board for London. BUILDING AND BUILDERS.

THE new half-timbered range of stabling, &c., in connection with Beech Holme, Colwyn Bay, North Wales, for Mr. W. H. Cogswell, of Calcutta, has been designed by Mr. T. E. Lidiard James, architect, of Lonsdale Chambers, 27 Chancery Lane, London, and will, when finished, be very complete in its appointments. The fittings are by Messrs. Musgrave & Co., the builder being Mr. J. Berth Jones, of Llanrwst.

The pinnacles of Tenterden parish church are being restored. Mr. Ewan Christian reported on their condition in 1877, and superficial repairs were undertaken in 1882, which Mr. Christian says are utterly useless. The original construction of the church, he says, was not of the most perfect kind, and the settlements and dislocation now apparent are due in a great measure to this infirmity of work.

The *Leeds Mercury* says that the Keighley Corporation, in an Act of Parliament they have recently secured, obtained the insertion of a clause prohibiting the erection of back-to-back houses in the borough.

It has been decided by the Postmaster-General that a new post office is to be built for Coatbridge if a suitable site can be secured.

The Housing of the Working Classes Committee of the London County Council, in reporting in reference to the disposal of Brooke's Market, point out that between Gray's Inn Road and Leather Lane, in the midst of many narrow courts and alleys, there was a group of dilapidated houses and sheds which, even in the worst part of London, could only be described as a disgrace to London. Some houses had recently been condemned and pulled down, and the number of persons to be displaced if the remaining buildings were pulled down was about sixty. The committee proposed that the area should be acquired by scheme under Part II. of the Act of 1890, provision being made for rehousing the persons displaced, and the remaining half-acre being utilised as an open space. The valuer had estimated the cost of the scheme, exclusive of paving works, at 4,750*l.* The committee recommended that the Council should approve of the scheme on condition that the Holborn District Board contributed 1,500*l.* towards its cost. Ultimately the Council sanctioned the scheme on condition that the Holborn District Board contributed at least one-half of the total net cost of the improvement.

The annual dinner of the Northampton Master Builders' Association has just been held at the Peacock Hotel. Some sixty members and friends sat down. Mr. J. B. Clarke, president for the ensuing year, presided, and the vice-chair was filled by Mr. Heap, vice-president. Others present were:—Mr. W. H. Smith, Mr. B. Smith, Mr. F. W. Dorman, Mr. Henry Martin, Mr. W. Hull, Mr. J. A. Piccarter, Mr. G. Stevenson, Mr. H. J. Airs (secretary), Mr. W. D. Gibbins, Mr. G. F. Fisher, Mr. C. Robinson, Mr. T. Jones, Mr. H. Green, Mr. H. W. Smith, Mr. T. Nevitt, Mr. J. Pullen, Mr. Wm. Gregory, Mr. J. Banks, Mr. Jos. Dunckley, Mr. Edwin Archer, Mr. W. Rainbow, Mr. G. H. Sharman, Mr. Geo. Goff, Mr. J. Albright, Mr. J. W. Walls, Mr. R. H. Gilby, Mr. Robert Cosford, Mr. John Bird, Mr. Edward Green, Mr. W. Dickens, Mr. J. T. Wingrove, Mr. J. Woodford, Mr. C. J. Branson, Mr. C. Sharpe, representing Mr. J. T. Sharp, Burton-on-Trent; Mr. Mr. A. C. Sharpe, representing Mr. A. Sharp, King's Lynn; Mr. W. Rayson, Mr. Josiah Walker, Mr. W. Barnicoat, Mr. W. J. Aster, Mr. H. Nurser, Mr. D. Mace, Mr. J. Bishop, representing Mr. J. T. Stanton, Lynn; Mr. J. L. Stanley, Mr. T. A. Fisher, Mr. E. D. Sharman, Mr. W. F. Agutter, Mr. H. Hensman, Mr. J. W. Walls, jun., Mr. F. Sheasby, Mr. Henry Law, Mr. G. P. Miller, Mr. T. L. Wright, Mr. Charles Day (Bath stone firms), Mr. H. Freear, Mr. Rennie Bruce (Messrs. Balmforth & Co., Luton) and Mr. Charles Tansley.—The loyal and other toasts having been honoured, Mr. W. H. Smith gave "The Architects of Northampton," a body of men of whom they were proud. The names of Mr. Hull, Mr. F. Dorman, Mr. F. Stevenson and Mr. Piccaver were coupled.—Mr. C. Day proposed "The Master Builders' Association." As far as building in the town was concerned, although not quite so large as in some other towns, it was as good as in any other part of England.—Mr. W. Gibbins proposed "The Chairman," congratulating Mr. Clarke on his succession to the office.—Mr. E. Green gave "The Health of the Vice-President, Mr. Heap."

AMERICAN NOTES.

Several years ago a charter was granted to a Canadian company for the purpose of utilising the enormous water-power of the Lachine Rapids. These rapids are only about five miles above Montreal, and the plan was to supply electricity to the whole city for a multitude of purposes. It was first necessary, however, to construct a dam across the northern channel of the St. Lawrence, which is there divided by small islands. There was great opposition to this from the municipalities along the south shore of the river, although the company's engineers declared the fear of floods to be groundless, and the scheme has not yet obtained the approval of the Department of Public Works at Ottawa. Negotiations are now in progress for the raising of 1,000,000*l.* in Europe to carry out the work as soon as this obstacle is removed.

Recent discoveries of tinted sandstones, limestones and of marble in Indiana are, *Stone* says, bringing Indiana to the front among stone-producing States. The quantity is large and the quality usually fine. Indiana's central position, geographically,

will give her a great advantage in the development of all such stone interests as may turn out well. The transportation question is a large and growing factor in the stone trade, and the proximity of Indiana to many large population centres, being in the centre of several populous States, must exert a beneficial effect on the future of her stone trade.

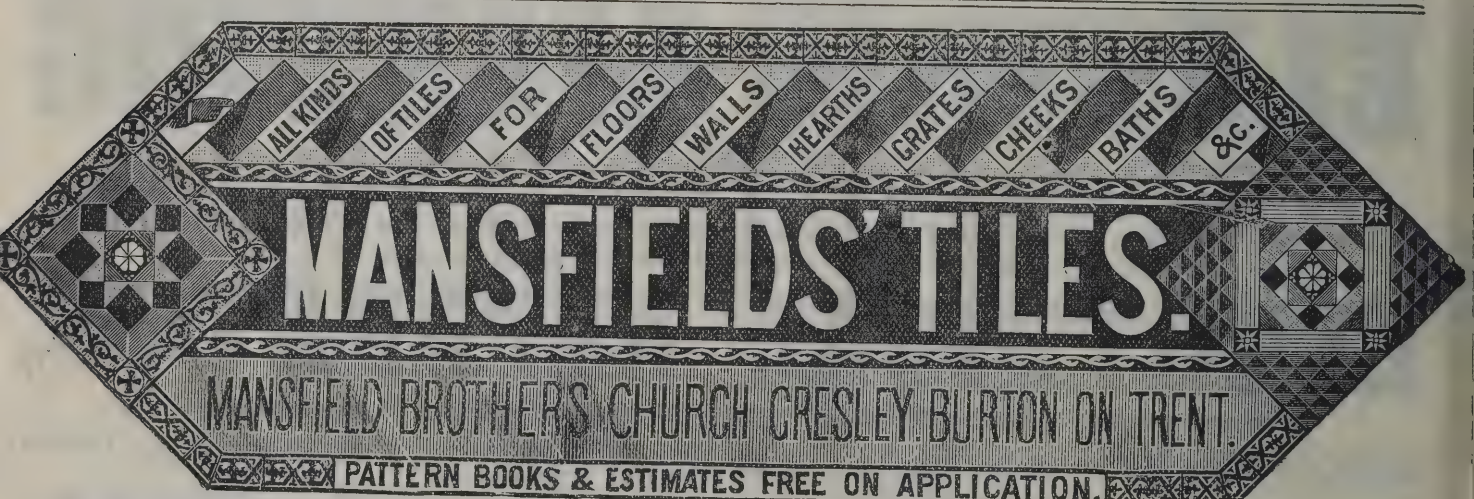
The paper, "Homelike Houses," read by Mr. Ernest Newton before the Architectural Association, is, the *Builder and Decorator* of New York says, as applicable in its criticisms upon the alien character of our modern houses to America as to England. We have many houses temporary stopping-places, but few homes.

The *Railway World*, Philadelphia, says:—The Great Northern Railway line has recently placed several large orders for bridge material and rail bolts with firms in Pittsburgh which will furnish a large tonnage for an initial line. The company is about to build a large iron bridge across the Mississippi at Minneapolis, and the contract for its construction has been let to the Pittsburgh Bridge Works. There will be between 300 and 400 tons of material used in this structure. The Great Northern is extending its line from Great Falls, Mont., to Seattle, on the Pacific coast, a distance of 900 miles, and to aid in the construction of this extension 2,000 kegs of bolts are needed. The order for them has been placed with the Pittsburgh Forge and Iron Company. They will comprise about 200 tons of freight.

Sir Douglas Fox has made a report on the feasibility of constructing a railway tunnel under the straits of Northumberland, to connect the shores of New Brunswick with those of Prince Edward Island. The greatest depth of water is 96 feet at high water, with a rise of tides of 6 feet at springs and 3 feet at neaps, and the speed of the current does not exceed three knots, with two hours of slack water at each tide. The distance from shore to shore is given at about 13,200 yards, or from shaft to shaft 13,500 yards, exclusive of land approaches, of which about 2,000 yards would be in tunnel. It is considered that about 5½ miles of railroad, including some 2,000 yards of tunnel, will be necessary beyond the shafts to connect the tunnel with the respective systems of railroad. To properly accommodate the Canadian and American rolling stock, the tunnel should have an internal diameter of not less than 18 feet. Such a tunnel, constructed in the shale, of brickwork in cement, 1 foot 10½ inches in thickness, and where feeders occur with cast-iron cases, 15 inches in thickness, with 9-inch flanges and laid with steel rails weighing 70 lbs. to the lineal yard, is estimated to cost 140*l.* per lineal yard, or, say, 1,890,000*l.* from shaft to shaft, or, with land tunnel and contingencies, a total sum of 2,225,500*l.*

The great dam across the Colorado river at Austin, Tex., is now, the Boston *Journal of Commerce* says, making substantial progress. This dam will be, when completed, 1,150 feet long, 60 feet high and 18 feet wide at the top. The up-stream face is of limestone and is vertical; the down-stream face is of Texas granite and the interior is rubble masonry of small stone and cement. There will be about 9,000 cubic yards of limestone and 50,000 yards of rubble in the dam. The estimated cost of the dam itself is 465,000 dols. To this is to be added the cost of the gate-house, the canal which is to convey the water to the manufactories and other auxiliary works, which is estimated at about 800,000 dols. more. The dam is intended to utilise the power of the Colorado river. The water-power will run the electric-light plant, furnish power for the electric railroads and for pumping the water-supply of the city, and leave a surplus of some 13,000 horse-power for the use of factories.

TRADE NOTES.



Mr. John Grundy, of 30 Duncan Terrace, City Road, London, N., is supplying his patent warm-air ventilating fire-grates to Upper Stratton School, Swindon.

A large church clock with three dials, and striking the hours and half-hours, has just been erected at Hayton, near Carlisle, by Messrs. John Smith & Sons, Midland Clock Works, Derby.

The ventilation of the new large Killarney Asylum, Ireland, has been entrusted to Messrs. Baird, Thompson & Co., ventilating engineers, London and Glasgow, their latest improved patent self-acting exhaust-roof ventilators being used throughout for the extraction of vitiated air, and their improved "panel" air-inlet wall ventilators, which introduce a supply of pure, fresh air without draughts.

The new Board Schools, North Ormesby, Middlesbrough, are being warmed and ventilated throughout by means of Shorland's patent Manchester grates, the same being supplied by Mr. E. H. Shorland, of Manchester.

Two engineering experts have been appointed to inquire and report regarding the sufficiency of the water power available from the river Ness and the Caledonian Canal, with the view

FLUATE
FOR HARDENING AND PRESERVING STONE.
Apply to the Bath Stone Firms, Ld., Bath.

of lighting the town of Inverness with the electric light. It was proposed to expend 10,000*l.* in extending the existing gas supply, but the matter has been delayed pending the report.

THE superintendent of Harbour Works, Aberdeen, Mr. James Pirie, has resigned his post on account of failing health.

THE fine new parish church at Hove, Brighton, which was designed by Mr. J. L. Pearson, R.A., is having a complete electric lighting installation erected under the superintendence of Messrs. Morgan Williams & King, consulting electrical engineers, Westminster.

THE contract for lighting the well-known Irish watering-place of Bray has been given by the town commissioners to Messrs. J. E. Gordon & Co., of London.

ON the recommendation of the Watching and Lighting Committee of the Glasgow Police Commissioners it has been agreed to purchase two steam fire-engines for use in the western and southern districts recently annexed, and also two 60-feet and two 40-feet fire-escapes.

THE report of Mr. W. Vawdrey, C.E., to the Stafford Town Council, as to the completion of the contract entered into with Messrs. Warner & Co. for providing and erecting engines, pumps and boilers for the pumping station at Milford, states that the whole of the work has been completed and the machinery started some considerable time, working as required to meet the supply. The boilers are well made and strictly in accordance with the terms of the specification, each plate having the required brand, and each boiler has been tested under a pressure of 120 lbs. per square inch and found perfectly tight, with the exception of a slight weeping at two or three rivets, which have been since caulked and made drop dry. The engines, with their attachments, are well formed in every respect, and the plans and conditions have been closely adhered to. The main pumps are also well and substantially made. I am not, however, able to report that the working of the machinery has been left by the contractors altogether in a satisfactory manner, inasmuch as in several instances the work has not been put together as it should have been; this is more particularly noticeable at the main pump ends, where a jar takes place at certain parts of the stroke, which, although partly attributable to the description of pumps adopted, is chiefly, in my opinion, caused by slight errors in the erection. Having regard, however, to the fact that these engines and pumps have been beneficially at work for the Corporation a considerable time, and as the terms and conditions of the contract have been carried out to the extent of the machinery being well and substantially made in accordance with the plans and specification provided, and as, in my opinion, the objections can, at comparatively small expense, be rectified by the Corporation, it seems to be advisable to settle at once with the contractor upon reasonable terms rather than let the matter remain open longer.

IN the case of the West Highland Railway Company against their contractors, Messrs. Lucas & Aird, the Sheriff-Substitute Gebbie authorises the Railway Company to carry on the railways and works, to relet the same or part thereof, and for that purpose to take possession of the railways and works and all materials, tools and implements, and declares the interim interdict formerly granted perpetual; finds the pursuers entitled to expenses, allows an account thereof to be given in, and remits the same, when lodged, to the auditor to tax and report, and decerns. An appeal has been lodged by Messrs. Lucas & Aird in the Scottish Court of Session.

THE London County Council have passed a recommendation of the Main Drainage Committee, that for the purpose of introducing the system of continuous treatment of the sewage at the Crossness outfall, the necessary weir walls be erected, and that this work be executed under Mr. Webster's contract for the precipitation works.

VARIETIES.

IN recognition of service to art in the Midland Counties, and notably by the gift of his unique collection of local ceramics to the Derby Art Gallery, Mr. Felix Joseph is to receive some very exceptional honours at the hands of that Corporation on the 21st inst. A special meeting of the Town Council has been called by the mayor (Sir Alfred Seale Haslam) for the afternoon of that day, at which a magnificent illuminated address, similar to the one accepted by Her Majesty, is to be presented to Mr. Joseph, with some fine specimens of modern Derby china, expressly manufactured for the occasion. In the evening Sir Alfred and Lady Haslam have invited 500 of the leading residents in town and county to meet their guests at a conversazione to be held in the Art Galleries, built by the munificence of the late Mr. Michael Bass, father of the present Lord Burton.

THE committee appointed for the restoration of the Wellington Monument at Wellington, Somerset, have decided

THE
"CLIMAX" VENTILATING CO.'S
DIRECT ACTING
CHIMNEY COWL,
For the Preventing a Blow-down.
This Cowl is specially designed for preventing a blow-down and assisting the up-draught. It is admittedly the most efficient in the market. Its construction is scientifically and mathematically correct, and no matter from what direction the wind strikes it, a powerful upward current is established. It is noiseless, has no movable parts to get out of order, is easily cleaned, the cone over inner shaft being made to push up. It has THE very decided advantage over every other Cowl, IT IS SIGHTLY.
PRICES AND PARTICULARS ON APPLICATION.
THE "CLIMAX" VENTILATING CO.,
15 GREAT GEORGE STREET WESTMINSTER, S.W.

that the repair of the obelisk shall be commenced at the earliest possible time next year, and that in the meantime any practicable work to prevent further dilapidation should be carried out. The amount required in its entirety is about 1,200*l.* The lowest tender for simply repairing the present dilapidation is 468*l.*

The Coventry City Council have received from the Local Government Board their sanction to borrow 4,479*l.* for improvements in Cox Street and Hill Street.

A movement has been started by Mr. Oscar Paterson at Glasgow for the institution of a Society of Ceramic Art for the study, examination, criticism and discussion of antique and other pottery, porcelain, glassware, stained glass and enamels, and to afford collectors of the antique, antiquaries, archæologists and students of industrial art a medium of communication and interchange of opinion on the subject of ceramic art and cognate matters.

An inquiry has been held by the Local Government Board into the application of the Corporation of Mossley for powers to borrow money for the purchase of the Whitehall estate, which they intend utilising for a Town Hall and pleasure grounds.

A scheme of improvements for Ilkley has been brought before the Local Board. It includes laying out the Rhyddings as a public pleasure-ground, improving certain of the public roads, building a new depôt and board offices, stabling, cottages, house for superintendent, a fire brigade station, public slaughter-houses, stores, shedding, workshops, &c. It was resolved to apply to the Local Government Board for sanction to borrow the sum of 10,000*l.* for the purpose of carrying out the works.

At the meeting of the Glasgow Corporation the Libraries Committee reported that having had their attention directed to a property on the east side of Queen Street, which was for sale, and the site of which might be utilised for an extension of the library premises, they recommended the Town Council to authorise 17,000*l.* to be offered for it, provided it was exposed for sale at or under that price. The recommendation was adopted.

A grand organ is to be presented by Provost Alexander, of Coatbridge, to the municipal buildings now in course of erection for the town.

The Aberdeen Incorporated Trades have decided to lay out as model gardens for working-men a portion of the ground at Gallowhill belonging to the Incorporation, extending along the south side of Trinity Cemetery, from the old Powder Magazine to Park Street.

Plans have been prepared by Messrs. D. & T. Stevenson, C.E., Edinburgh, for the construction of a timber pier and wharf at Uig Bay, Skye. The pier, which will consist of greenheart piles, will be about 1,000 feet in length.

The Aberdeen Harbour intends to spend 12,000*l.* in widening and improving Waterloo, Trinity and Market Quays.

The Widnes Local Board, in conjunction with the Runcorn Improvement Commissioners, intend to memorialise the County Councils of Lancashire and Cheshire in favour of the construction of a bridge for vehicular traffic across the Mersey between Widnes and Runcorn. The work would be very costly, as the river is about a quarter of a mile wide.

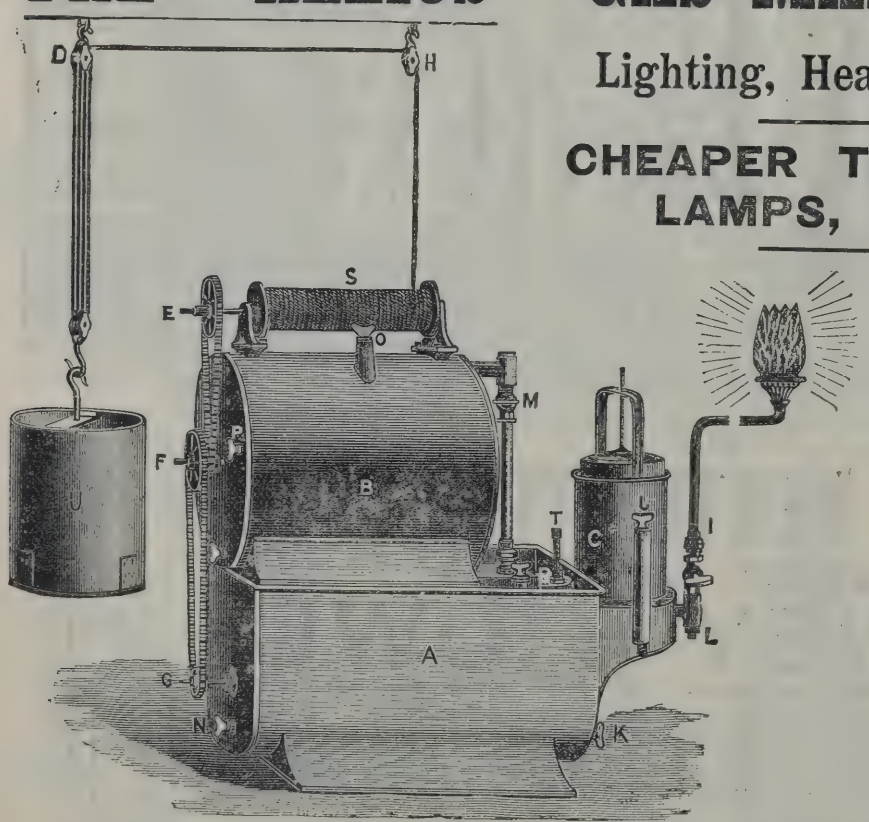
The Leith Dock Commissioners have decided on constructing a dry dock at an estimated cost of 25,000*l.* to the south of the Prince of Wales's Graving Dock, plans for which are to be prepared.

At the meeting of the Malvern Local Board, it was resolved to advertise for tenders for carrying out the projected works for a new water-supply and for a loan of 40,000*l.* The plans have been drawn up by Mr. Copland, C.E.

A committee of the Ilkley Local Board have recommended that an Act of Parliament should be obtained for the compulsory purchase of the gas undertaking and the providing of an additional water-supply.

The purchase has been agreed to by the Walsall Town Council of 3,384 square yards of land in Lichfield Street from Lord Hatherton, as the site for public baths, at the price of 1*l.* per yard. It is stated that about 1,000 yards would be available for use for other purposes, or for sale.

At Dundee the Police Commissioners have condemned a property in William Street, King Street, inhabited by about a dozen tenants, as uninhabitable; and a number of owners of properties in Black's Croft have been granted a month to submit plans showing improvements of their buildings.



At Balsall Heath a Local Government inquiry has been held with respect to applications by the Local Board for sanction to the borrowing of 5,960*l.*, for laying out a recreation ground and for street improvements, and 13,704*l.* for law costs and other charges arising out of the actions between the Board and the Warwick and Birmingham Canal Company and the King's Norton Rural Sanitary Authority.

THE "HELIOS" GAS-MAKING MACHINE

FOR

Lighting, Heating, and Motive Power.

CHEAPER THAN COAL GAS, OIL LAMPS, OR ELECTRICITY.

This Machine is the latest development of the Oil Gas systems. In most other such machines Gasoline is the gas-producing material, and as this can only be procured in large quantities, and is dangerous to store, there is naturally a great objection to its employment. The "Helios" Gas Machine is charged with Benzoline, which can be procured anywhere in large or small quantities. The Machine is simple, and the light produced far superior to coal gas. Machines made to supply from 6 to 2,000 lights.

Prices from £10 10s.

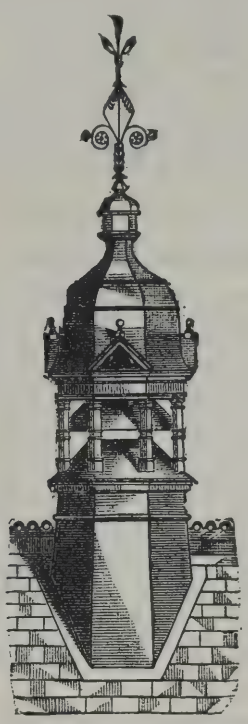
UNEQUALLED FOR

COUNTRY HOUSES, FACTORIES, HOTELS, &c.

FOR FURTHER PARTICULARS APPLY TO

THE INCANDESCENT GAS LIGHT CO., LIM.,

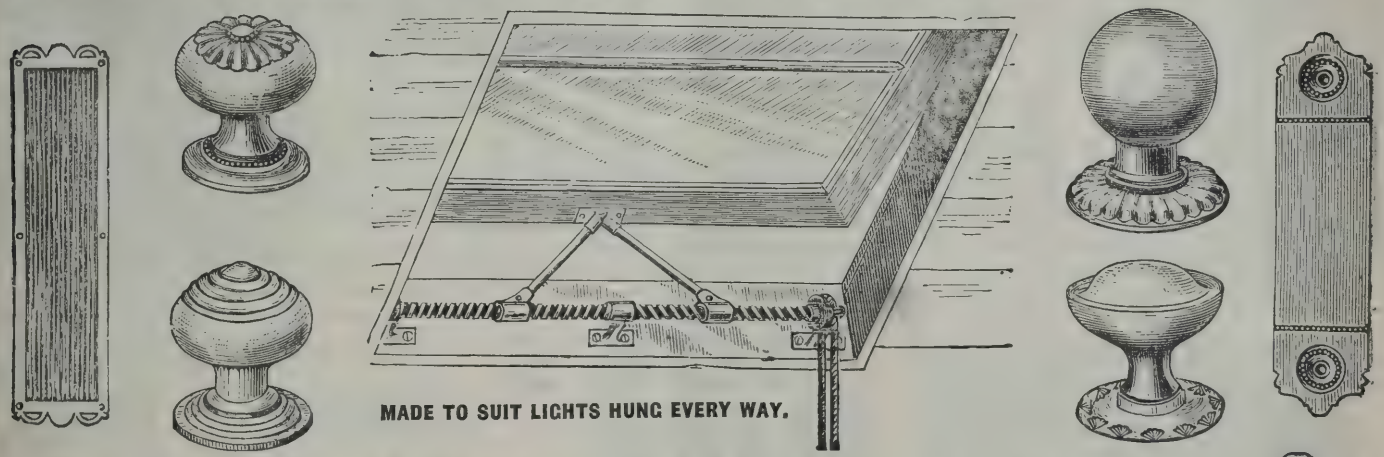
14 PALMER STREET, WESTMINSTER, LONDON.



THE assistant borough surveyor of West Hartlepool, Mr. Matthew Scott, has been appointed surveyor for South Stockton.

HOUSE LETTING IN PALERMO.

A CURIOUS custom which prevails at Palermo in regard to house letting is mentioned by the British Consul at that place in his last report. All houses must be taken in the month of May for possession on September 1 following. A more inconvenient arrangement it is almost impossible to imagine, since the changing of houses and apartments (and the Palermitans change very often) takes place universally on August 31, generally one of the very hottest days of a hot summer. "The confusion of the furniture and goods of outgoers and incomers, and the amount of perspiration and swearing rendered necessary must be witnessed to be realised; the porters and furniture movers have a hot and busy but lucrative time of it, and take advantage of the pressure of business in the way of increased terms. Sometimes the streets are quite encumbered with masses of ingoing and outgoing furniture, not to speak of countless heavy articles of furniture being lowered from the uppermost floors and suspended in mid-air. During the year of the last cholera epidemic here," the Consul says, "the municipality wisely forbade people to change houses at the usual date, but we are coming back to the old custom. After September proprietors abandon hope of letting apartments for another year, although they will not object to entertain the notion of letting a house for a broken year if a foreigner applies. This, however, is an irregular and temporary arrangement; a regular lease must run from September 1, and the rent for the whole year, as a rule, be paid in advance, especially by foreigners."



NOTES ON NOVELTIES.

WE have had lately brought to our notice several new designs of the "Grahtryx" fixed self-acting exhaust roof ventilators, patented and manufactured by Messrs. Baird, Thompson & Co., the well-known ventilating engineers, of London and Glasgow. These ventilators can be made suitable to harmonise with any style of architecture, with or without base and flange, as shown, and to architect's designs, or in plain designs for use in turrets at a very moderate cost. They have also been recently improved, and are an excellent apparatus for the efficient extraction of vitiated air from public and private buildings, soil-pipes, &c. The illustration shows their No. 10 design, which is being adopted for the two large new schools erected by the Falkirk School Board from designs by the School Board architect. The "Grahtryx" ventilator is extremely simple in action, is

free from noise and the interior arrangements are so complete that it is proof against the admission of snowdrift and rain, and from whatever direction the wind blows it creates a powerful upward current without any possibility of a blow down. The whole of these ventilators are made of strong galvanised steel plates of the best quality by an entirely new method not dependent upon solder, thus assuring great strength and durability.

HILL'S PATENT SKYLIGHT AND FANLIGHT OPENERS.

MADE TO SUIT LIGHTS HUNG EVERY WAY.

HILL'S PATENT LOCKS AND FURNITURE.

LARGE STOCK AND SHOW-ROOM.

Prices and Particulars on application.

JAMES HILL, 100A QUEEN VICTORIA ST., LONDON, E.C.

ONE of the great desiderata in the building world is a lock that will never get out of order, and yet is efficient in every sense of the word. Whilst visiting the Dairy Exhibition at the Agricultural Hall this week, our attention was drawn to a well-assorted selection of locks and latches, the inventor of which claims that there are no springs in its mechanism, that the handle, which is of a unique construction, cannot work loose, and that neither require oiling at any time. Both lock and handle work on the gravity principle. The invention will probably be brought out by a company, and works that are already in successful operation abroad will be included in the purchase. We understand that Mr. Freemer, of 200 and 202 Phœnix Street, N.W., is interested in this introduction.

IMPROVED TELEPHONES.

OUR contributor last week, in the article "Improved Telephones," gave some particulars which seem to require describing more clearly. We may therefore state, first, with regard to the "Sphinx," that Messrs. Grist & Turner only claim that it is 50 per cent. cheaper with reference to the combination movable telephone; secondly, their intercommunication system cannot be used by a firm to communicate with its clients, because, in the first place, this would constitute an "exchange" and would require a license from the Post Office, which it is impossible to obtain; and, thirdly, if the offices of the clients were some miles apart the system would be too costly. The system is intended for a large firm which has many departments or offices scattered about at a distance of a few hundred yards each. Messrs. Grist & Turner are the only firm who make a specialty of this work. Fourthly, the Co-operative Wholesale Society, Limited, Manchester, have two immense blocks of buildings but not shops in different parts of the city, the length of the cable being about half a mile.

PROMENADE PIER, TORQUAY.

THE committee appointed by the Torquay Local Board to inspect promenade piers at various watering-places have reported that they visited Plymouth, Great Yarmouth, Lowestoft, Hastings, St. Leonards, Eastbourne, Bournemouth, Brighton and Scarborough, and inspected the piers. They recommend the construction of the proposed pier at Torquay, and that it should be erected in connection with the present groyne. That it should be constructed of iron screw piles and wood decking, so as to give an approach for a distance of 736 feet, or thereabouts, 30 feet wide, and a height of not less than 9 feet above high water, the widened portion being placed on the Tor Abbey side of the structure; that the width of the angle, and for a distance of about 214 feet, be similarly constructed not less than 100 feet for the purpose of enabling a suitable pavilion, at least 70 feet wide, with sheltered seats, to be erected thereon; that the outer length or cant of the groyne to the end thereof be similarly widened out and at the height previously mentioned to a width of 50 feet, and provision made for the erection of a band-stand and shelters, and that landing-places in suitable places be provided; the whole to be carried out for a total estimated capital outlay of 30,000*l.* The committee recommended the necessary steps being taken to apply to the Board of Trade for a provisional order to carry out the work. The scheme could be made a progressive one, and the work carried out in four sections, the respective cost of which would be 7,000*l.*, 7,000*l.*, 8,000*l.* and 6,000*l.* Plans for the work have been submitted to the Board.

THE PURIFICATION OF RIVERS.

AT the annual Congress of German Naturalists and Medical Men, just held at Halle, an interesting paper was read in the hygienic section by Professor Von Pettenkofer on the self-purification of rivers. His researches and experiments were made on the waters of the river Iser at Munich, but they can be applied to the water of all town rivers. Munich has 280,000 inhabitants, and 20,440 kilogrammes of refuse are carried into the river every day. But, again, each day 3,456,000 cubic centimètres of fresh water flow down the stream, so that the proportion of refuse or dirt to the water is only 6 to 1,000,000, or 6 milligrammes to the litre, a pollution which if artificially produced in a glass of water is unrecognisable to the naked eye. Careful examination has shown that even this pollution disappears seven kilomètres below the city. This self-purification of rivers had hitherto been attributed to sedimentary deposits, but Pettenkofer is convinced that it is the effect of oxygen, partly freely dissolved in or absorbed by the water, and partly produced by water plants. He considers that the great quantity of low vegetable organisms in water plays a great part

in the purifying process. The vegetable growth in river beds should, according to Pettenkofer, be protected, and refuse water from mills, chemical works, &c., which is destructive to vegetable growth, should not be allowed to flow into rivers unpurified.

HEALTHY DWELLINGS.

One of the latest extensions of the work of the Yorkshire College, says the *Leeds Mercury*, is the institution of a Department of Sanitary Engineering, and Mr. W. Spinks, A.M.Inst.C.E., delivered the first of a series of lectures on the subject in the Philosophical Hall, Leeds. The particular branch of the subject chosen, the question of "Healthy Dwellings," coming in the midst of the discussion that is now going on in the town as to back-to-back houses, and the condition of the slums of Leeds, naturally attracted a large audience.

Mr. Jno. Marshall, chairman of the Council of the Yorkshire College, who said he filled the position of *locum tenens* for Dr. Pridgin Teale during his temporary absence, expressed the pleasure of the Council of the Yorkshire College to be able to add to the teaching they offered lectures on sanitary engineering, the object of which, as he, an unscientific person, interpreted it, was to diminish the amount of preventable disease and death from preventable disease. That was an aim which must come home to all of them, and he was glad that the action of the County Council had enabled them to bring Mr. Spinks to address them.

The lecturer remarked that the application of the principles of health, though a science as old as humanity, had only obtained a recognised position very recently. Of late years a strong feeling had grown up that the general health was one of the most important cares of a Government. The tendency of men to collect for their profit in large cities and the immense development of trade, had aggravated the causes of infection, and created the duty of protecting the population against the manifold causes of insalubrity. The material causes of deterioration and disease were principally impure air, impure water, insufficient and unwholesome food, dampness of soil, deficiency of warmth; and the removal of these causes was the principal aim of practical hygiene as enforced by legislative enactment. From 1875 to 1890, thirty-three Sanitary Acts applicable to the country had been passed, the principal of which were the Public Health Acts, 1875, and Amendment Act, 1890, the Infectious Diseases Notification Act, 1889, the Infectious Diseases Prevention Act, 1890, and the Housing of the Working Classes Act, 1890. Dealing first of all with the necessity of a house being properly sewered and drained, and condemning the system of dry closets as well as the pail system, Mr. Spinks turned to the question of streets and passages, and pointed out that the streets around the dwelling-houses of the working-classes were, as a rule, the playground of the children. So that when streets were unpaved or paved with stones that allowed water to gather and collect, the children playing near it breathed the emissions from the filth and dirt which would not reach the adult. In the paving of back yards and passages it would be a good thing if the local authorities were a little more particular in the choice of the material they used. The Housing of the Working Classes Act was, he said, one of the most important that had been passed for a long time. It was divided into two parts, the first dealing with unhealthy areas, and the second with unhealthy dwellings. It provided that if twelve ratepayers signed a petition declaring what they believed was an unhealthy area, it was the duty of the medical officer of health to inquire into the matter. And as they had a number of back-to-back houses in narrow, confined streets, where it was almost impossible for the air to circulate, and where the plaster and floors and other porous materials in the houses were impregnated with miasmatic matter, making it impossible for any one to live properly, the value of such a clause was very great. Again, if four persons were of the opinion that the existence of a house or building was prejudicial to the proper circulation of air to other houses, they had the right to draw the attention of the authorities to the matter, and expect them to take action. In Leeds and other large towns they had rows upon rows of houses which looked very gorgeous and noble from the outside, but which were very deceptive, and one found on getting inside the house that he was obliged to come out the same way. The particular question of back-to-back houses had been thoroughly and carefully investigated about three or four years ago by Dr. Barry and Mr. Gordon Smith for the Local Government Board. There was no doubt that their conclusions were that back-to-back houses were simply the device of what he would call the "land sweater." They decided (1) That the practice of building houses without provision for through ventilation is still in vogue to a considerable extent in many Yorkshire towns; that in some districts the proportion of such houses to houses provided with means for through ventilation is very large and is steadily increasing. (2) That the erection of houses upon the back-to-back principle,

in the way commonly practised, tends to promote the huddling of houses, and the consequent crowding of persons upon an area to a degree which is incompatible with health. (3) That so far as structure is concerned, certain facilities exist in back-to-back house construction under which the efficiency of party-walls may be less than in the case of through houses, but that otherwise the details of house-construction generally are similar in both classes of houses. (4) That little or no improvement has taken place in the ventilation of back-to-back houses themselves, and that this applies even in districts where, under comparatively recent regulations, not more than four or eight houses may be built in one block. (5) That improvement in the method of excrement disposal has continuously gone on in the districts visited, but in this respect much still remains to be done. In some cases grave disadvantages to decency and health accrue from the custom still prevalent in certain districts of grouping privies in blocks at an excessive distance from the houses, a practice which is still more objectionable when each such privy has to serve the inhabitants of two or more houses. (6) That the accommodation afforded in through houses is usually superior to that afforded in back-to-back houses of a similar extent. (7) That the difference in the cost of construction of a through house and a back-to-back house respectively, each affording the same accommodation and built equally well, is very slight indeed; the advantage, such as it is, being with the back-to-back house. The medical officer of health for Manchester had just presented a report to the Council on the subject of back-to-back houses in the slums, and it had been decided to demolish the whole lot, 9,300 in all. If the powers conferred by these new enactments were only taken advantage of, they would have the effect of doing away with the jerry-builder, the property-jobber and the land-sweater. In conclusion, the lecturer supposed the possibility, by the adoption of proper precautions, of reducing the death-rate in a district of 10,000 people from 24 to 14. That meant a saving of 100 lives per annum, a diminution of the sickness rate and a consequent saving in cost of medicine, of funerals, of wages earned, of 8,185*l.* 10*s.*

Dr. Pridgin Teale, who had taken the chair, expressed the belief that the authorities of the Yorkshire College must be gratified at the large numbers in which they had met together, as that evening marked a somewhat strange departure in the history of the college. It was the inaugural lecture of a gentleman appointed to a new lectureship, which in itself was due to a grant of money from the West Riding County Council. It was marvellous to think what strides had been made in the question of the public health, and then Dr. Teale described at some length the education of the medical officers of health, the improvement in the condition of the education of the plumber, on whose work the health of the country so largely depended, and the better education of sanitary inspectors, and to these two latter classes, and to young architects and builders, he argued, the initiation of this lectureship must prove of immense benefit.

PRESSURE ON WALLS OF SWIMMING-BATHS.

At the last meeting of the Stafford Town Council a report was read respecting the defects in one of the walls of the swimming-bath. The Baths Committee decided to repair the breach immediately and to build a continuous buttress around the bath, the dimensions of which should be determined by the borough surveyor. Mr. Matthews, in moving the adoption of the report, said the fracture which took place in the bath was 5 yards in extent, and the cost of repairing would be 17*l.* 6*s.* The expense of erecting the continuous buttress and concreting would amount to 56*l.* The breach in the wall had been rebuilt and the subway bottom was being concreted to a height equal to the bottom of the swimming-bath at the deep end. At the back of the deep end the concrete would be carried to the top of the bath the same thickness throughout, thereby connecting the deep end of the bath with the main wall of the building. The committee resolved upon this somewhat extreme course for the purpose of inspiring the necessary confidence of the public in the bath. The borough surveyor proposed as the work of concreting was being done to admit the water slowly to the bath in order that the necessary moisture might get to the lias lime and so enable it to set. After expressing the regret of the committee at coming before the Council with such a report, Mr. Matthews said there were two reasons brought forward at the committee meeting to account for the fracture. One was whether the wall was sufficiently strong, and the other was whether sufficient time had been allowed for the walls to knit together before the water was let in. The committee were compelled to accept both of these reasons and to act upon them, and the report of the committee was based upon them. The error which had been discovered by experience was that they should have admitted the water gradually to the bath. He pointed out that the lime in the wall had not to dry as many people supposed, but to set, and that the water was an absolute

necessity in order to allow this to take place. There was no truth in the rumour that the matter had been rushed for the purpose of opening the baths. Six months ago contracts were completed for the building of the baths, the intention being that the swimming-bath should be opened in three months' time. Had the dates been adhered to, the bath would have been opened at the end of July, and that being the case would any one have said, had the bath broken down, that the committee were rushing the matter? Instead of hurrying, they had had a continuous series of delays, and if the committee had not urged the work forward with a view to obtaining revenue from the bath during the remainder of the swimming season, he presumed the committee would have been charged at the hands of the Council with great remissness. There was at no time any apprehension whatever of danger resulting from immature work, and it was not until after the accident that it was found that the time for filling the bath instead of being one day should have been perhaps two or three weeks. The figures prepared by the borough surveyor would prove, he believed, that while the pressure of the water would be 12 cwt. per lineal foot, the resisting power of the concrete would be more like 37 cwt. per lineal foot. In conclusion, Mr. Matthews pointed out that the plans for the erection of the baths, which were prepared by the borough surveyor, were sent to the Local Government Board and passed successfully. Mr. Flamank declined to second the adoption of the report, as he did not agree with the decision of the committee. Alderman Wright seconded the motion. Alderman Peach alluded to the fact that there had been another report presented by the borough surveyor, which the committee had not had time to discuss fully and properly. As the committee would meet shortly to discuss that report, he proposed an amendment that the discussion be adjourned till the next meeting. Mr. Wormal seconded the proposition. Mr. Bagnall, having suggested that the plans of the whole bath be submitted to a professional gentleman, the amendment was carried.

THE NEW RAILWAY TO LONDON.

As has already been reported, the Bill promoted by the Manchester, Sheffield and Lincolnshire Railway Company to authorise the extension of their system to London will be again brought before Parliament in the coming session. In the main the measure will be very much what it was when rejected by Mr. Woodall's Committee, but it has undergone important modifications in detail, with the view of meeting the more serious objections raised against the scheme last session. These modifications chiefly affect the question of the proposed London terminus, the plans for which have been considerably altered and extended. Some deviations from the route originally laid down between Beighton Junction and Quainton Road are also provided for to meet the requirements of local authorities and landowners. Besides the St. John's Wood land—to the disturbance of which such strong objection was offered by artists and others resident in the locality—it is now sought to acquire the ground bounded by Grove Road, the north side of Church Street, Edgware Road, and St. John's Wood Road. This is in No. 3 ward, half of which, it is estimated, will be swept away for railway purposes if the new project be sanctioned. Then in No. 4 ward the land needed extends from St. John's Wood Road to Marylebone Road at the corner of Allsop Place, and thence to Lisson Grove, excluding the Grove itself, but the plan contemplates a line from Harewood Place to the corner of Alpha Road. Thus nearly the whole of No. 4 ward would be occupied by the new railway project should it prove more fortunate in the House of Commons than the old one.

THE BIRMINGHAM WATER SCHEME.

THE following is the report of the Water Committee of the Birmingham Corporation on the proposed source of supply :—

The necessity of extending the sources of the water supply of Birmingham and the district supplied by the Corporation is so fully recognised that we need spend no time in dealing with this part of the case. Last year the daily average demand for water reached its highest total, 17 million gallons, rising on some days to a maximum of 22 million gallons. Towards meeting this demand we obtain from the streams and rivers controlled by the Corporation about 8 million gallons daily, and from deep wells sunk in the sandstone about 9 million gallons per day, which will be increased by the new well at Rubery to 10½ million gallons. The storage reservoirs at Whitacre are capable of yielding in times of extreme pressure, from dry weather or from increasing demand, an additional supply of about 3 million gallons daily. Altogether therefore we have resources equal to the supply of 22 million gallons of water daily. But the demand steadily rises, at the rate of about 3½ per cent. annually, and consequently in a very few years our means

of supply will not be more than equal to the average daily consumption. It is needless to point out the consequences of a water supply inadequate to the demand; the dangers of shortness of water, and still more those of a water famine, will be realised by every consumer. It is necessary therefore to make provision for an increased supply. But how? It might be possible, by an expenditure of something like 2,000,000*l.*, to so extend the existing works as to make them adequate for perhaps twenty years, by making new storage reservoirs at Whitacre and by sinking additional wells in the sandstone—twenty-five, at least, of such wells being required. But the present gathering-ground in the watershed of the Blythe and the Bourne is deteriorating in character, owing to high cultivation and the increase of buildings; and besides we have no assurance that the sandstone wells would bear the enormous additional strain which would be thus imposed upon that source of supply. Even if the plan above indicated were to be adopted, it would meet the necessity only for a limited period, and long before that period had elapsed—say, in twelve years' time at the farthest—it would be imperative again to look ahead for new supplies. Our own district being exhausted, we should then have to go to some remote mountain region for our water supply; but by that time the best available gathering-grounds would have been appropriated, and Birmingham would find itself at a deadlock. Therefore—it is a demonstration—the wisest, safest and ultimately the most economical course is to go further afield at once, and to make such a provision as to insure the security of our water supply for at least fifty years to come.

The necessary conditions of a satisfactory water supply have to be kept in view in deciding this vital question. There are five essential conditions to be satisfied:—(1) Ample quantity of water; (2) certainty of maintaining the supply; (3) purity of the water; (4) impossibility of future contamination; (5) delivering the water by gravitation, to save the cost of pumping to a high level, which is now requisite in Birmingham, for all the water we use has to be pumped a height of about 250 feet. All these conditions are satisfied completely by the district recommended by the Water Committee as the gathering-ground of our future water supply, namely, the watershed of the rivers Elan and Claerwen, near the little town of Rhayader, in Mid-Wales, distant about eighty miles from Birmingham. This district was suggested nearly twenty years ago by Sir Robert Rawlinson as the source best adapted to the requirements of Birmingham; and the judgment of this eminent engineer has, after recent examination and inquiry, been confirmed by Mr. J. W. Gray, the engineer to the Corporation Water Committee; by Mr. Mansergh, the engineer called in by the committee to advise them; and by such authorities as Sir Frederick Bramwell and Mr. Hawkesley, who have likewise minutely examined the ground. The area of the watershed is ample; it covers 70 square miles, or about 46,000 acres, nearly six times the present municipal area of Birmingham. The quality of the water, tested carefully by chemical and other experts, is unimpeachable—it is pure and soft. The freedom from possible future contamination is beyond question, for on the 70 square miles there are fewer than 200 persons, and no more can come there, for the district is incapable of cultivation, and therefore cannot attract residents, and there are no roads which visitors can traverse. As to quantity and certainty of supply, these are demonstrated by the fact that the rainfall, taken for a series of years, shows an average of 66 inches a year, as against 28 in the valley of the Blythe and the Bourne, our present gathering-ground for river water; while, owing to the conformation of the valleys of the Welsh district, the storage capacity may be raised to any degree that can possibly be required. As to delivery by gravitation (thus obviating the cost and risk of pumping), it is enough to say that the lowest contemplated reservoir is 800 feet above sea-level, or about 200 feet above the highest point of Birmingham, and that other reservoirs are projected at a height of more than 1,000 feet above sea-level. Thus, all the essential conditions are complied with—amplitude of supply, certainty, purity, guarantee against deterioration and delivery by gravitation, in other words, by a perpetually running stream.

We do not, of course, presume to think that our opinion can add confirmation to the judgment of experts in water supply; but this is a case in which the main conditions can be justly estimated by those who do not pretend to expert knowledge; and no one who examines this district of Mid-Wales can fail to be satisfied as to its remarkable suitability to the designed purpose. After having carefully gone over the valleys of the Elan and Claerwen, examined the watersheds of both rivers and inspected the sites of the proposed reservoirs and works, we have no hesitation in saying that the district chosen by the Corporation engineers is a perfect source of water supply for a great and growing town. Standing beside the upper reaches of the Elan, six or eight miles above Rhayader, a good general view of the district can be obtained, and the characteristics which mark this portion of the watershed also mark that of the

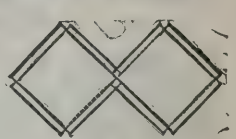
Claerwen, which is divided from the Elan by a range of hills rising to about 1,600 feet. The base of the hills and valleys is the slate formation, on which grows a short and scanty vegetation, just capable of yielding sustenance to a few sheep. There is very little bog or peat; the water from the hillsides runs into the two streams above mentioned, which are exquisite in their purity and freshness. The landscape is wild beyond description: broad valleys, low rolling hills, rising into higher ridges to an altitude of about 2,000 feet. There is no sign of life beyond the scattered sheep, and here and there a solitary shepherd; there are no dwellings but a few shepherds' huts and an occasional house of a sheep-farmer, and these are so rare that they have to be searchingly sought for before they can be discovered. There is no cultivation of any kind; on the Elan watershed and the upper portion of the Claerwen side there is no wood—not so much as a solitary bush. Since nature finished her work and cast this district into its final mould, there has been no change in it; nor, within the view of human prevision, can there be change. Everywhere the eye rests upon a vast solitude, bathed in the purest air, swept by the freshest winds, a landscape brown and bare, clothed only with the scantiest herbage, broken only by transparent rills. Nothing wilder or remoter or more solitary or freer from any chance of change can be imagined. It is an ideal gathering-ground for the purest water; if nature had arranged it for the purpose it could not have been more perfectly fitted to its intended use. The conformation of the ground is adapted admirably for storage. The valley basins, surrounded by lofty hills, constitute reservoirs which seem to be made ready to the hand of the engineer; all that is needed—and this at no great cost, or necessitating specially elaborate works—is to throw here and there a dam across the river courses; and then the river beds themselves and the hills on each side will form the beds and the retaining walls of the storage lakes, while the materials for the construction of the dams required are to be found in abundance on the ground.

It is impossible without the aid of a map to describe the river courses, or to explain the situation of the dams which are to bank up the streams into lakes. We can therefore only speak generally. We have already mentioned that the rivers Elan and Claerwen flow through valleys on either side of a dividing range of hills. At the base of this range they meet and unite at a point in the Claerwen Valley, called Nant Gwilt, and thence under the single name of the Elan the conjoined streams flow on into the Wye near Rhayader. At Nant Gwilt, just below the confluence of the streams, it is intended to construct the principal dam, and to form the chief storage lake; the exact site is named on the Ordnance map as Caban Côch. Here the retaining dam will stretch across the valley at a height of 80 feet, and the top level of the water will be 800 feet above sea level. The lake will not be one sheet of water visible at a glance, but will follow the lines of the valleys and the hillsides, being half a mile across at its broadest, narrowing in its numerous reaches and inlets, and varying in its depth according to the configuration of the landscape contours. Its total length will be something over three miles, its total area will be 497 acres, and its total storage capacity will be 7,540 million gallons of water. These figures are scarcely capable of being realised, but a standard of comparison may be afforded by the statement that our present reservoirs at Whitacre have an area of 90 acres and a storage capacity of 600 million gallons. All the water in the Caban Côch will not, however, be at the disposal of Birmingham, for we shall have to make compensation to the rivers below the great storage lake, and the overflow will consequently run into them. But no one need be alarmed at the prospect of this necessary compensating arrangement, for the complete system contemplated includes five other reservoirs, situated higher up than the great lake of Caban Côch. Two of these are to be placed upon the river Elan, and three upon the river Claerwen. The names, areas and contents of the whole of the reservoirs are as follow:—

	Area in Acres.	Storage Capacity in Million Gallons.	Height above Sea Level.
(*a*) Caban Côch . .	497	7,540	800
(*b*) Dol-y-Mynach . .	148	1,500	900
(*c*) Pen-y-Gareg . .	124	1,320	945
(*d*) Craig-yr-Allt Côch .	217	2,000	1,040
(*e*) Cil Oerwynt . .	269	3,100	1,095
(*f*) Pant-y-Beddau . .	244	1,900	1,175
Totals . .	1,499	17,360	—



Caban Côch, as already mentioned, is below the confluence of the Elan and the Claerwen; Dol-y-Mynach, Pant-y-Beddau and Cil Oerwynt are on the Claerwen, and Pen-y-Gareg and Craig-yr-Allt Côch are on the Elan. All these storage reser-

voirs, however, will not be made at once. Caban Côch, the largest, will come first, and probably two of the others will be constructed immediately afterwards. The rest will be brought into use as they are wanted for future supply—twenty years hence perhaps or more than that, while the highest of all, Pant-y-Beddau, may not be required for fifty years to come, when the whole service of over 60 million gallons daily may be necessary for the supply of Birmingham and its neighbourhood.

We have now described the sources of the supply and the arrangement and capacity of the storage reservoirs. We have next to see how the stored-up water is to reach the consumers in Birmingham. Eighty miles have to be traversed before the delivery is accomplished, and on the route chosen by the engineers it will be possible to bring the supply in what is virtually a straight line, involving no special engineering difficulties. The delivery will start with a short tunnel from the Caban Côch reservoir, and will then be continued by varying means—iron pipes, cut-and-cover work (that is, a covered conduit), and occasional tunnels through intervening rock. The course will run past Rhayader, Knighton, Ludlow, Cleobury Mortimer, Bewdley, Hagley, to Frankley, where a reservoir will be constructed, and from that reservoir the supply will flow on to the Monument Road reservoir, and thence it will be pumped up to a higher reservoir to be made at Warley, for the convenience of the highest portion of the district which cannot be satisfactorily reached by gravitation. The proportion of tunnels, conduits and pipes may be roughly stated as about nine miles of tunnel, 35 miles of "cut-and-cover" conduit, and 35 miles of iron pipes. The conduit and the tunnels will be made of the full capacity required for the ultimate full supply, namely, 8 feet in diameter. The iron pipes will be 42 inches in diameter. When the scheme is completed—say fifty years hence—five of these pipes will be required. For the present only two pipes will be laid, additions being made as the demand increases. The first portion of the work, it is computed, will be completed in ten years from the passing of the Act of Parliament needed to authorise the execution of this vast project.

Now, finally, for the cost. Here we can do no more than transcribe the estimates of the engineers, for they alone are capable of making an estimate, and with them the responsibility of it necessarily rests. Two reports are presented on this part of the matter—one by Mr. Mansergh, and the other by Mr. Gray. The estimate of Mr. Mansergh is that for the first portion of the work—all that we shall need to execute for many years to come—the cost will be 3,340,700*l.* This will include the making of the great reservoir, and probably two others, the provision of the full-sized tunnels and conduits and of two lines of iron pipe. For the ultimately complete scheme, including the six reservoirs and five lines of pipe, Mr. Mansergh's estimate of the cost is 5,654,953*l.* In these estimates we observe Mr. Mansergh includes a very large allowance for contingencies, amounting in the complete scheme to no less than 1,027,676*l.*—an allowance which is sufficiently cautious, doubtless an error on the right side, if it is an error at all. Mr. Gray reports that, having made an independent estimate of "the works on the Elan and Claerwen streams, and of the aqueduct, reservoirs, filter-beds and main pipes necessary to deliver the waters from these streams to the reservoir of the department at Monument Road," he is of opinion that "the estimated cost of these works [that is the first portion], amounting to 3,340,700*l.*, is sufficient for the works therein stated"—that is, in Mr. Mansergh's estimate. Some other works, estimated by Mr. Gray at 281,250*l.*, for the improvement of our present service within ten years, will have to be provided for in the proposed Bill, and provision will also have to be made for the extension of mains for forty years to come; but these latter amounts will of course be applied only as the demand for them requires. The finance of the scheme is described in the report of the Water Committee. The committee expect to cover the cost in three ways:—First, by raising the water-rents by the sum of 28,000*l.* a year, thus reimposing part of the reductions conceded some years ago, accumulating this amount until it is needed by the expenditure on the scheme; second, by postponing the repayment of capital for, say, ten years from the commencement of the scheme; and third, by the growth of water-rents, which, it is calculated, will have so increased by the year 1918 as to allow the water-rents to be again reduced. These calculations have been tested by Messrs. Howard Smith & Co., the accountants to the department, and—allowing, of course, for unforeseen contingencies—may be assumed to be well founded. These, then, are the main features of a project which is the greatest that Birmingham has yet undertaken—one of the greatest undertaken by any municipality in the three kingdoms. That it will be entered upon with a light heart we cannot say, but we do say that it is not so much justified as compelled by necessity. Whatever the cost, we must have an adequate and unfailing supply of pure and wholesome water, for without it we cannot live or have our being, whether as individual consumers or as members of a great commercial and industrial community.

REGISTRATION OF PLUMBERS.

A LARGE and influential meeting of the Master Plumbers' Association of Glasgow and suburbs was held in the Waterloo Rooms, Glasgow, recently, Mr. William Rattray, the president, in the chair, to consider the present position of the Association in regard to registration. The Chairman explained the objects of the movement and its present position, showing how largely it had spread by the powerful aid of the Worshipful Company of Plumbers, London, since its first inception at the International Health Exhibition in London in 1884. A long and interesting debate *pro* and *con* succeeded, in which Messrs. Campbell, Caldwell, Calderwood, Alex. Brown, W. P. Buchan, D. Fulton, Symington, Day, Arnott and W. Anderson took part. On the motion of Mr. Costello, seconded by Mr. McPheat, it was carried unanimously—"That this Association approves highly of the National Registration of Plumbers, and does all in its power to support the movement." The master plumbers of Glasgow were represented at the original Plumbers' Congress in London in 1884, and a number of the chief masters joined the registration movement directly it was set on foot. The majority of the qualified master plumbers of Glasgow and the district have since become registered, but hitherto the Master Plumbers' Association as a body has not officially declared its opinion in favour of registration, so the recent resolution of the Association is deserving of notice.

The work of the session's plumbers' class, Glasgow, commenced with distributing the prizes given through the Plumbers' District Council and the prizes and certificates of the City and Guilds Institute for the work of last session. Mr. Thomas Russell, chairman of the governors of the college, presided. Dr. Henry Dyer and Mr. Ebenezer Kemp, two of the governors, also attended. The District Council was represented by Professor Jamieson; Messrs. David Thomson, architect; A. M. Scott, writer; Buchan, Rattray, Speirs, Stevenson, master plumbers; and M'Culloch, operative plumber. There were also present:—Mr. Coles, of London, the representative of the Plumbers' Company; Mr. M'Donald, master plumber, Edinburgh; and Mr. Willoughby, of the United States Department of Labour, Washington. There were upwards of 100 students in attendance. After Mr. Scott had intimated apologies for non-attendance the chairman distributed the prizes. The District Council's prizes for the Glasgow class were nine in number, and for the Greenock class seven. These prizes were in the form of books bearing directly or indirectly on the craft of the plumber. William M'Alpine, of the Greenock class, was presented with the first City and Guilds' honours grade prize in the United Kingdom, viz. a silver medal and 3*l.* in money. Robert Young, of the Glasgow class, received the third City and Guilds' prize in the ordinary grade for the United Kingdom, viz. a bronze medal and 1*l.* in money. Some fifty City and Guilds' certificates for passes were also presented. The students were addressed by the chairman, Dr. H. Dyer, and Messrs. Coles, Thomson, Rattray, M'Culloch, M'Donald, Fulton (the class lecturer) and Buchan. It was mentioned in the course of the speaking that an Ayrshire technical school for plumbers affiliated to the college was being promoted.

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Cassell, Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.*]

APPLICATIONS FOR PATENTS.

16391. James Tate, for "Burning and drying bricks."

16403. John Finlay Peddie, for "Improvements in apparatus for testing sewers, drains, soil-pipes and the like."

16434. Arthur Mills, for "Improvements in padlocks."

16570. Arthur Warner, for "Improvements in springless locks or latches."

16641. Joseph Lewis, for "An improved coupling for lightning-conductors."

16645. Edmond Keith Abbott, for "Improved device for preventing windows from shaking."

16668. Malcolm McLean, for "An improved safety lock and key."

16690. Conrad Koch, for "Improvements in hinges."

16768. Herbert Hy. Green, for "Improvements in or relating to lifting latches."

16830. Conciano Canciani, for "Improvements applicable to extension ladders."

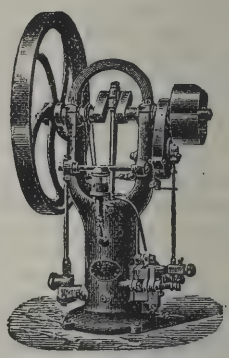
THE

"GRIFFIN" GAS ENGINE.



In the Competition for Gas Engines held by the Society of Arts,

GOLD MEDAL

Awarded to the "GRIFFIN" Gas Engine.

Horizontal Type.

Single-acting Vertical Engine,
From ½ to 4-Horse Power.

CHEAPEST, SIMPLEST, AND MOST ECONOMICAL GAS MOTOR.

SUITABLE AND USED FOR

Hoisting, Sawing, Printing, Pumping, Grinding, Mining, Chaff Cutting, Polishing, Organ Blowing, Sewing Machines, Dairy Work, Boot Making, Pulverising, Soda Water Machinery, &c., &c., &c.,

AND UNEQUALLED FOR ELECTRIC LIGHTING.

Professor JAMIESON, M.I.C.E., F.R.S., Glasgow, in his Scientific Report, says:—

"Throughout the whole of my electrical test the *Engine* WORKED VERY STEADILY; *in fact I have never before tested a Gas Engine which maintained such uniformity of speed* at full power; *no pulsation or blinking being observable in the incandescent lamps.*"

And Professor KENNEDY, F.R.S., M.I.C.E., University College, London:—

"There is no doubt that it is a most important practical advantage of the 'Griffin' type of Engine, that it can be made to accommodate itself to variations of resistance not only without alteration of mean speed, but also without alteration in the number of explosions per minute, and therefore, without any alteration of steadiness."

TRADE NOTES.

ON November 2, Mr. Gilbert Dalziel will publish from *Judy* office "The Round Table Annual" for 1892, being a series of stories written by A. Dewar Willock, and entitled "Taradiddles." The book is fully illustrated by W. F. Thomas.

A THREE-LIGHT window has been fixed in the south chapel of the new church, Fenton, Stoke-on-Trent, by the Turner family; the subject, "Our Lord as the Great Physician" in the centre light, and the "Sick coming for Healing" in the side-lights. The figures are placed under canopies of fourteenth-century treatment, and in the tracery angels bear the text, "The leaves of the tree were for the healing of the nations." The window was executed from the design of Mr. T. W. Cannon, at his studio, High Street, Smethwick, near Birmingham.

MR. JOHN GRUNDY, of 30 Duncan Terrace, City Road, London, is now supplying his patent warm-air ventilating fire-grates to the Leicester Asylum.

AN ornate oak lectern has just been presented to Brooking Church, Totnes. It was designed by Mr. Edmund Sedding, of Plymouth, and executed by Messrs. Rashleigh, Pinwell & Co., of the same town.

SHORLAND'S patent warm air ventilating Manchester grates are being used in the new workhouse, Abergavenny. They are supplied by Mr. E. H. Shorland, of Manchester.

THE "Tenor" bell, about 9 cwt., at Pedmore Church, near Hagley, has just been rehung by Messrs. Charles Carr & Co., who also have secured the contract to rehang and quarter the peal of six bells at Cookley Church, near Kidderminster.

A LARGE clock has been erected in the tower of the parish church, Sawston, near Cambridge, which will supply a long-felt want, and no doubt be highly appreciated by the village and the district around for many miles. The clock has been made throughout by the well-known firm of Messrs. Potts & Sons, at their clock factory, Guildford Street, Leeds. The clock at Sawston shows the time on two external dials, 5 feet diameter, bolted into the walls of the tower; the hands, figures and minutes are gilded, and the background, painted black, makes the time to be distinctly seen at a distance. The clock also strikes the hours upon the large new tenor bell and the Cambridge or Westminster musical four quarters upon four others of the new peal. The clock is well made on the best principles from the designs of Lord Grimthorpe (Sir E. Beckett, Bart, Q.C.), the great authority on clocks, and has his gravity escapement, compensated pendulum and many other of his inventions and improvements, which will, with ordinary care and attention, enable it to be a first-class timekeeper.

THE *Birmingham Post* says:—The Moxley Ironworks, which were carried on for many years by Messrs. T. & C. Wells, but which have been standing for some time since the

demise of those gentlemen, have been taken by Mr. William Nock, and will be restarted in a short time.

THE tender of Messrs. R. Neill & Son, Manchester, has been accepted by the directors of the Blackpool Tower Co., for the massive concrete foundations for the tower. The work will be proceeded with immediately, and the contracts for the steel superstructure, 500 feet high, will be placed shortly.

THE laying of the new marble pavement in Peterborough Cathedral has been commenced. The cost, 2,000*l.*, will be defrayed by Dean Argles. It is intended to erect a reredos, which will be brought forward so as to restore the arrangement as it existed in the old Benedictine choir.

"WATCHES, Clocks, Jewellery and Plate" is the title of a pamphlet just published by Mr. Benson, which contains over 200 pages of illustrations, &c. It is by far the largest and most complete work of its kind issued. It will be sent post free to any part of the world by Mr. J. W. Benson, of the steam factory, 62 and 64 Ludgate Hill, E.C., or from his West-End house, 25 Old Bond Street, London, W.

THE ventilation of New Cook Street Church, Belfast, is being carried out by Messrs. Baird, Thompson & Co., ventilating engineers, London and Glasgow, who have introduced their latest improved self-acting exhaust roof-ventilators for the extraction of the vitiated air, and their improved "Panel" air-inlet wall ventilators for the supply of pure fresh air without draughts.

A SHORT time ago the Queen of Holland had her palace at The Hague fitted up with English fire appliances. The Khedive of Egypt has just followed Her Majesty's example and bought a "Metropolitan" pattern steam fire-engine, with hose and accessories, from the same firm, Messrs. Merryweather & Sons, of London. This engine will always be kept ready for use in case a fire may occur in the palace. It may be mentioned that the firm mentioned built a floating steam fire-engine for Alexandria a few years ago, which has done excellent work.

FOR some time past extensive alterations have been in progress at the Newtown (Mon.) Gasworks. The effect of the improvements will be to produce a largely-increased quantity of gas at a less cost. The contract for the ironwork was let to Messrs. R. & J. Dempster, Newton Heath, Manchester; that for the retorts to Messrs. J. Drake & Sons, Halifax; and that for the brickwork to Messrs. Morris & Sons, builders, Newtown. The practical completion of the work was celebrated by a dinner given to the workmen.

AN important correspondence is proceeding between the Board of Trade and the London County Council in regard to the present unsatisfactory standard of light adopted in the Acts controlling the gas-supply of London.

IT is stated that aluminium substituted for cast-iron in the tower of the new public buildings in Philadelphia will save 400 tons in weight, and avoid the constant expense of painting.

BUILDING AND BUILDERS.

A NEW Roman Catholic church, erected from the designs of Messrs. Pugin & Pugin, has been opened at Paisley, affording accommodation for nine hundred worshippers.

THE handsome pavilion erected by the Peninsular and Oriental Steam Navigation Company from designs by Mr. T. E. Collcutt at the Naval Exhibition, was brought under the hammer at the Mart, Tokenhouse Yard. The building was purchased for 500*l.*, and it is understood that a permanent home for it will be found in the grounds of the Devonshire Park Club at Bournemouth.

A MOVEMENT is on foot for the restoration of the church of St. Mary's, Salcot. The building is in a very dilapidated and even dangerous state. Only a part of the original nave is left, the other part, with the chancel, having fallen years ago. The remaining walls are very much out of the upright. It is estimated that 1,200*l.* will be required to carry out the work.

AS a matter of precaution, a sea-wall is to be built to protect the Rhyl Pavilion. Two grand side entrances are also to be erected.

GOVERNMENT works, according to the *Leeds Mercury*, are usually carried out with a deliberation which does not ordinarily characterise private undertakings. Though the preparatory operations on the site of the new General Post Office in Leeds were commenced three or four months ago, the erection of the building has not yet been begun. The foundations have been dug and the area walls built, but for some weeks what was previously a scene of activity has presented a deserted appearance. The reason for this delay is probably only known at the office of the Board of Works. Owing, it is said, to the architect having received wrong information respecting the level of the sewer with which the drains must be connected, the concrete foundations will have to be raised a foot or two; but the necessity for this alteration was discovered several weeks since,

Awards—Gold Medal, Saltaire, 1887; Silver Medal, Brussels, 1888; Silver Medal, Paris, 1889; Gold Medal, Brighton, 1889.

BRITANNIA TIN AND COPPER WORKS.
TO ARCHITECTS AND BUILDERS.

Fountain Street, Bury, and Shiffnall Street, Bolton:
February 13, 1891.

Gentlemen,—We have pleasure in announcing that we have opened extensive Show Rooms at 117 QUEEN VICTORIA STREET, LONDON (opposite Civil Service Stores).

We have been very successful in Lighting and Ventilating Public Buildings in all parts of the Country.

We have a large stock of Sunlights, Turrets, Exhaust Roof Outlets, Tobin's Tubes, Air Grids, &c., &c., at our Show Rooms.

We feel confident that our DESIGNS, as well as our system of Lighting and Ventilating will commend themselves to all who are interested in having BRILLIANTLY LIGHTED and WELL-VENTILATED ROOMS.

A visit to our Show Rooms will be esteemed a favour. If inconvenient to call, send for one of our illustrated Catalogues, inspect our Designs, and read our Testimonials.

Trusting to receive your favours, which shall have our prompt attention,
We remain, Gentlemen, yours obediently, J. H. PICKUP & CO.

NO FAMILIES WHO VALUE THEIR HEALTH SHOULD BE WITHOUT ONE OF THE

LONDON AND GENERAL WATER PURIFYING COMPANY'S, LIMITED,

House Cistern, fitted with a Cistern Filter.

PATENT CISTERN FILTERS, Charged Solely with Animal Charcoal. Requiring, when once fixed, NO attention whatever, and superior to any others. *Vide* Professor Frankland's Reports to the Registrar-General, July 1866; November 1867; and May 1870. The *Lancet*, January 12, 1867.
Also, Testimonials from Dr. Hassall, September 23, 1863; the late Dr. Letheby, February 15, 1865, and December 1872.
Price, £1 10s. and upwards. Portable Filters on this System, £1 5s. to £3.
Patronised and used by Her Majesty the Queen at Osborne, by H.R.H. the Prince of Wales at Sandringham, by H.R.H. the Duke of Edinburgh at Eastwell, by H.R.H. the Duke of Connaught at Bagshot Park, by H.R.H. the Duke of Cambridge, the *élite* of the Medical Profession, and at the London, Middlesex, St. George's, St. Mary's, Consumption, Fever, and German Hospitals, and various Lunatic Asylums, Institutions, Breweries, &c., and at all the Schools established by the School Board for London. Pocket Filters, 4*s.* 6*d.* and 6*s.* each. Household and Fancy Filters, from 10*s.* Water-Testing Apparatus for detecting Impurities in Water, 10*s.* 6*d.* and 21*s.* each.

Portable Cistern Filters.

157 STRAND, W.C. (Four Doors from Somerset House), LONDON.

and yet the work remains to be done. We learn, however, that the alteration in the plans, which was conceded by the Post Office authorities in deference to the representations made on behalf of the Corporation and other local bodies, has been completed, and that in all probability the structure when raised will be more in harmony with the desires then expressed than it would have been had the original design been adhered to.

At the meeting of the Stratford-on-Avon Rural Sanitary Authority plans were submitted for the proposed joint sanatorium, the estimated cost having been reduced to 5,700*l.*

The late Herr Aders, who died a little while ago in Düsseldorf, left over a million marks for the benefit of the working-classes of his native town. The responsible authorities, after due consideration, have decided how to use Herr Aders's munificent gift. It is proposed to build comfortable houses for worthy working-men and their families. The cottages are to be erected in the suburbs, and within a reasonable distance of the men's work.

The Board of Guardians for Beverley have again discussed the question of providing a new workhouse infirmary. The Local Government Board had approved of plans for a structure to cost between 3,000*l.* and 4,000*l.* A section of the Board was in favour of a smaller scheme to cost not more than 2,000*l.* A resolution was adopted that the architects should prepare an estimate of the exact sum which the larger scheme would cost.

The Dean of Guild Court, Edinburgh, have granted a warrant to the trustees of the Sick Children's Hospital to take down and remove the present hospital, and to the Edinburgh Co-operative Building Company to erect three tenements at Hollybank Terrace.

VARIETIES.

The Durban Corporation have recently formally appointed Mr. W. H. Radford, C.E., of Nottingham, consulting engineer for the new sewerage of the borough, to act in conjunction with the resident borough engineer, Mr. John Fletcher, C.E. It is proposed to lay about twenty miles of sewers at once, special care being taken to make them watertight in consequence of sandy waterlogged subsoil. The sewage will be pumped into a set of storage and screening tanks, from which it will be discharged into the Indian Ocean on the ebb tide. The sewage outfall has been selected, after careful tidal, wind and wave investigations, and it will be near the end of the "Point," at the entrance to the Durban Harbour and Bay. Powerful engines and pumps will be put down, and probably part of the power will be derived from refuse destructors. The Corporation have obtained powers to borrow 150,000*l.* for the sewerage, but the first section is estimated to be completed for 70,000*l.* Durban is the chief Natal port, and is a most enterprising, wealthy and rapidly increasing town; and, in addition to the sewerage, the above engineers are associated with extensive additions to the waterworks, now approaching completion, and also with additions to the tramway system.

At the meeting of the Leeds County Council a letter was read containing a copy of the following resolution, passed by the Pious Use Committee:—A letter from the Mayor of Leeds to the vicar, as chairman of this committee, having been read, it was resolved that this committee, understanding that the Corporation have an opportunity of acquiring the Quebec estate, contribute the sum of 2,000*l.* towards the expense of making the site an open space with as little delay as possible, and that if this offer be accepted this committee at once take steps to procure the necessary legal authority to carry it out. The Council have decided to offer 33,000*l.* for the estate, towards the purchase of which the Midland Railway Company contribute 3,000*l.*

Two thousand five hundred pounds have been subscribed towards building a vicarage at Scunthorpe, Lincolnshire.

A proposal by the Corporate Property Committee of the Leeds County Council to expend 2,812*l.* in improving the sanitary arrangements of the Town Hall, according to the Borough Engineer's plans, has been referred back to the committee, a number of the members objecting to the placing of pipes outside the building, as was suggested.

It has been decided to enlarge the harbours of Candia, Rethymo and Canea, in the island of Crete. Specifications, &c., and particulars of the work to be had on application to the Governor-General of the Island.

The Main Drainage Committee of the London County Council have recommended the reconstruction of 2,000 feet of the Limekiln Dock sewer, and that plans and specifications should be got out and tenders invited. Also the acceptance of the tender of Messrs. Spurr, Inman & Co. to supply two high-pressure steel Lancashire boilers for Crossness station at 460*l.* per boiler.

The representative committee appointed by the Liverpool City Council to consider the details connected with the starting

of a nautical school at Liverpool have decided to recommend that such a school be founded. It is stated that about 1,000*l.* is required to fit up a building for the purposes of the school, and that the annual cost of the institution will not exceed 2,500*l.*

AT the meeting of the Idle Local Board a letter was read from the Local Government Board stating that shortly they would hold an inquiry into an application made for sanction to the expenditure of 25,000*l.* on sewerage works.

A REPORT has been submitted to the Aberdeen Town Council by a committee as to the propriety of providing for increased storage and additional filter-beds at Invercannie in connection with the Corporation waterworks. The construction is recommended of an additional storage or settling reservoir at Invercannie, capable of holding about 35,000,000 gallons, with six new filter-beds. The cost of the land and works is estimated at 67,000*l.*, which includes the site for a second storage reservoir. The committee has been empowered to consult a professional engineer on the whole question of the water-supply for the city, also to institute proceedings for preventing the contamination of the Dee by the discharge of sewage at certain villages.

THE *Manchester Guardian* understands that steps will be shortly taken for carrying out the long-contemplated reflooring of the nave of Manchester Cathedral. Towards this object a considerable amount has now been subscribed. Nothing has been decided, so far, as to the material for carrying out the work, but the principal mover in the undertaking is strongly in favour of the reflooring being carried out in black and white marble.

THE construction of a tunnel under the Danube, similar to that under the Thames, is projected. It is proposed to construct it for tramways, as well as passenger and vehicular traffic.

AT the meeting of the Court of Common Council it was referred to the County Purposes Committee to consider and report on the state of the law as to lamps in common domestic use for the consumption of dangerous mineral oils, and to make suggestions thereon.

AT a meeting of ratepayers of Denny and Dunipace, a report was read from Professor Dittmar, Anderson's College, Glasgow, in which he condemned as unfit for internal use the gravitation-supply introduced into Denny a year ago at a cost of about 14,000*l.*

THE Khojak Tunnel, the *Indian Engineer* says, ranks as the eleventh longest in the world; of the other ten, six are on the continent of Europe, three in England and one in America. With the one exception of the Hoosac Tunnel in America the Khojak is far longer than any other in Asia, Africa, America or Australia.

A RAILWAY scheme for New York advocates underground railways on each side of the city and across the town underneath Union Square and Fourteenth Street; express trains running on special lines at the rate of forty miles an hour; electricity for power and lighting; the block system and the latest methods of ventilation. The proposed railways would be thirty miles in length, embracing 100 miles of single line.

THE Swansea Corporation have decided to go to Parliament for permission to spend 230,000*l.* on a new water scheme, the new source of supply being the watershed of the river Usk. Thus an estimated additional supply of 5,500,000 gallons a day would be obtained. It was also decided by the Corporation to institute an inquiry into the advisability of amalgamating the Harbour Trust with the Corporation, it being estimated that were Parliament to sanction this a saving of 10,000*l.* a year in interest alone might be effected owing to the cheaper rate at which the Corporation can borrow.

THE Leith Town Council have resolved, in view of the proposed new dock, to write the Dock Commission that it would be desirable, for the convenience of the public, to continue the promenade from Seafield right along to the East Pier, and to afford convenient access for the public either from the shore or from Constitution Street.

IN connection with the proposed scheme for lighting Inverness by electricity, Mr. Fraser and Mr. Lowe, engineers, London, have made an examination of the Caledonian Canal, accompanied by members of the Town Council. Several sites were found suitable, but the general feeling was in favour of taking the water from the Canal at a point opposite Holm Mills, where a fall of about 35 feet should be obtained. This, it is calculated, would give about 400 horse-power, and be more than ample to light the principal streets and public buildings.

MR. FELIX JOSEPH has presented to the Derby Art Gallery specimens of old Derby crown china, representing various periods of its manufacture. The gift is worth at least 3,000*l.* In recognition of his munificence the Town Council have held a special meeting, and presented Mr. Joseph with an address,

"SPHINX" PORTLAND CEMENT

112 lbs. per bushel. Slow setting; test 1,000 lbs. to 1¼ inch; seven days. Fineness, 2,500 meshes to square inch, with less than 10 per cent. residue. Over 10,000 tons supplied to Cardiff and Hereford Water Works.

Specially adapted for Concrete Floors and Street Paving.

"ECLIPSE" PORTLAND CEMENT

Quick setting; test, 3 parts. Standard Testing Sand, 230 lbs. per square inch; 28 days. The finest, most plastic, best sand carrying, and cheapest Cement in the market. Specially adapted for laying encaustic tiles, making joints in sanitary pipes, internal stucco, concrete foundations, &c.

Samples sufficient for Practical Tests Free. Manufactured by

together with a handsome collection of the royal porcelain at present manufactured in the town.

A visit has been paid to the proposed source of a new water-supply for Shrewsbury and Chester. Mr. E. Griffith, speaking on the occasion, said he had taken them that day to the birth-place of the River Ceiriog, and, if they built an embankment 50 feet high, they could get a capacity for holding 600,000,000 gallons, and if they carried it 12 feet higher it would almost double the capacity. He put down Chester at 50,000 inhabitants and Shrewsbury at about 30,000. The distance to each of these places from Chirk is twenty-one miles, and ten miles to the reservoir. The pipes to Shrewsbury would be 11 inches and to Chester 14 inches. They would have no engineering difficulty, nor any with the landowners.

The Borough Surveyor of Southampton has, as ordered by the committee, applied to different towns for information relative to the receipts and expenditure of Turkish baths, and has received returns from ninety towns; from the information contained in them the committee were of opinion, having regard to the population of Southampton, it would be a loss to the town to establish Turkish baths. The cost would be 1,000*l.*, which would have to be paid out of revenue account, and according to estimate given by the surveyor, the working expenses would amount to 220*l.* yearly.

CHICAGO EXHIBITION NOTES.

More than 15,000,000 feet of lumber will be used in the construction of the huge building for manufactures and liberal arts.

The foreign commissioners—Sir Henry Wood and James Dredge, of England, Herr Wermuth, of Germany, and Dr. Emil Meyer, of Denmark—are greatly impressed and pleased at the building plans and extensive preparations for the exposition. Mr. Dredge says:—"I have examined the plans very carefully. They contemplate the erection of magnificent buildings. They are bold, striking and, I may say, far in advance of our anticipations. From an architectural point of view I do not believe they could be improved. And I am assured that the landscape effects will be in harmony with the architectural features. Mr. Olmstead is the greatest landscape-engineer in the world. The work he has done for the World's Fair shows that."

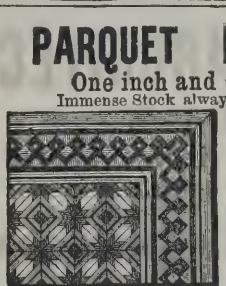
American jewellers are contemplating the project of massing their exhibits at the exposition, believing that a more effective showing can be made in that manner. The matter s not yet decided. Foreign jewellers are preparing to make an exhibit of unprecedented extent and value.

The Association of Civil Engineers of the City of Mexico will attend the exposition in a body.

M. O. Jaensch, of Wahoo, Neb., writes to Chief Allison offering to the exposition a valuable collection of arms. The collection includes 100 pieces, including swords, pistols, guns, &c., being a complete showing of all the different swords and firearms made from the time of the invention of gunpowder down to the Franco-Prussian war. Mr. Jaensch says the collection was left him by will. He offered it to the exposition without cost.

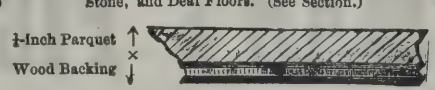
Lieutenant Baker, special commissioner for the World's Fair to Mexico, reports that Mr. Berringer, a prominent merchant and landholder in Tabasco, will send to the exposition a magnificent collection of the cabinet-woods of Mexico. He promises to show a specimen of every variety of cabinet-wood in the republic of Mexico.

A Turkish flag was hoisted at the World's Fair grounds on Sept. 20 with appropriate ceremonies. It was raised on the site which Robert Levy, of Constantinople, has secured for his Turkish specialties. He will reproduce a Constantinople street, show most of the striking features of Turkish life, and have a novel and interesting collection of Turkish goods and curios.



The Massachusetts building at the exposition will be modelled after the historic old Hancock House, which stood on Beacon Street, Boston, for fully 125 years. Built by his uncle in 1737, this mansion was occupied by John Hancock, the signer of the Declaration of Independence when Governor of Massachusetts, and there he entertained Washington, Lafayette and many other distinguished revolutionary patriots. Massachusetts will spend 35,000 or 40,000 dols. in imitating at the World's Fair this famed mansion. The building will be used almost exclusively as a State head-quarters and club-house.

The National Brick Manufacturers' Association has appointed a committee of five to secure an international exhibition of clayworking machinery for the World's Fair, and the committee has issued an address inviting the views of the trade.



Sir Henry Wood, of the British Royal Commission, says that it is the present intention of the Commission to build at the exposition a typical old English manor, or hall, as the English head-quarters. He says also that an exact reproduction of Shakespeare's house at Stratford-on-Avon will be built if the necessary space can be secured.

VOLUME XLV. OF THE ARCHITECT.
Handsomely bound in Cloth, Gilt Lettered. Price 12*s.* 6*d.*—Office: 175 Strand, London, W.C.

The Grounds and Buildings Committee decided to advertise for the construction of a building to accommodate four saw-mill plants. The structure will be located south of the agricultural annexe, on piles driven in what is now a natural lagoon. The building will be 130 feet by 200 feet, and will cost 25,000 dols.

Two granite columns for the Woman's Building have been contributed by Mrs. Alice Houghton, lady manager, of Washington. The columns are 15 feet high, 20 inches in diameter, and will be placed in the main entrance on the east side of the Woman's Building.

The horticultural exhibit will be on a scale never before attempted in the history of the world. Mr. Thorp, of the floriculture division, estimates that the equipment of the horticultural building, including the purchase price of plants, will be 350,000 dols. and the total expense of the display 750,000 dols.

The Brazilian Government intends to make a magnificent display at the exposition, and will invest not less than half a million dollars in carrying out the plans for its representation. It is proposed not only to erect a building in which to display the magnificent resources of Brazil, but to surround that building with practical illustrations of the methods of agriculture and industry. There will be a sugar mill in operation, a coffee quinta, at which the method of gathering and curing coffee for the market will be illustrated, and the manner in which rubber is gathered and prepared for market will be shown in a similar way. There will be also several facsimiles of native huts, with native families living as they live at home and pursuing their industries. It is proposed also to have the national band of Brazil in attendance.

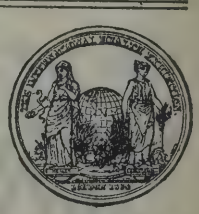
Rudolph Cronau, author and scientist, of Leipzig, Germany, has tendered to the exposition his extensive collection of paintings, sketches and photographs, representing scenes in the life of Columbus and places visited by Columbus during his voyages to the new world. Dr. Cronau has spent a great part of his life in the study of early American history, and has published a work on the subject, based entirely upon his personal investigations.

Chief Ives, of the Department of Fine Arts, has written to Director-General Davis, from Paris, that he has no longer any doubt of the Fine Arts section of the Fair being a notable success. A grand art exhibit from France is assured. It has been thought by many that the only particular in which the Columbian exposition would fail to surpass the recent Paris exposition was in the fine arts exhibit. Now it appears that because of America being the most promising market for art productions, England, France and Germany will make special efforts to provide a notable exhibit in that line. While, in respect to an exhibit of the productions of the old masters, the Chicago exposition may be inferior to the late Paris show, it seems probable that it will surpass it in the exhibition of the best efforts of modern artists.

The Colorado Marble and Mining Company has offered to donate sufficient marble to erect the Colorado State building at the World's Fair. The only conditions the company makes are that its members shall be consulted with reference to the construction of the building, so that the effect and beauty of the marble can be brought out to the best advantage, and that the State pay the railroad freight on the material from Colorado to Chicago. It is claimed that in durability, tone, colour and finish the Colorado marble is equal to any that is imported from Italy.

Lord Stanley has promised to do all he can to have the Dominion of Canada make a creditable exhibit at the exposition. Many prominent Canadians are equally interested, and have promised their aid. This result is due in a large measure to the exertions of J. Allen Hornsby, of the Department of Electricity of the exposition, among the delegates to the recent National Electric Light Association at Montreal.

E. T. Jeffery, chairman of the Grounds and Buildings Committee of the exposition, made the following estimate of necessary exposition expenses for submission to the recent meeting of the National Commission:—Buildings, 7,295,000 dols.; grading and filling, 450,000 dols.; landscape, 323,490 dols.; viaducts and bridges, 125,000 dols.; piers, 70,000 dols.; waterway improvements, 225,000 dols.; water supply and sewerage, 600,000 dols.; railways, 500,000 dols.; steam plant, 800,000 dols.; electricity, 1,500,000 dols.; statuary on buildings, 100,000 dols.; vases, lamps and posts, 50,000 dols.; fuel and light during construction, 20,000 dols.; seating, 8,000 dols.; World's Congress, 200,000 dols.; improvement of lake front, 200,000 dols.; general expenses of Construction Department, 500,000 dols.; organisation and administration, 3,308,563 dols.; police, watchmen and other expenses, 1,550,000 dols. Total 17,825,453 dols.



Farmers, Farmers' Alliances, and other rural organisations will be provided for in a special building at the World's Fair.

ART PLATES FROM "THE ARCHITECT."

AWARDED GOLD MEDALS,

International Health Exhibition and Architectural and Building Trades Exhibition (1889).

PROOF IMPRESSIONS

OF

JOHN SELL COTMAN'S PICTURES,

LATELY ON EXHIBITION AT THE

BURLINGTON FINE ARTS CLUB.

The Plates are uniform in size, 21 inches by 15 inches.

The Titles are as follows:—

No. 1. The Storm at Sea.
„ 2. Twickenham.
„ 3. A Shadowed Stream.
„ 4. The Draining Mill.
„ 5. On the Greta.
„ 6. The Château, Normandy.
„ 7. Rouen from Mount St. Catherine.
No. 8. Breaking the Clod.
„ 9. View in North Wales.
„ 10. Norman Arches.
„ 11. Byland Abbey.
„ 12. Norwich, from the Cromer Road.

„ 14. Mousehold Heath.
No. 15. Cader Idris.
„ 16. Castle Eden Dean, Durham.
„ 17. Bamborough Castle.
„ 18. The Interior of Norwich Cathedral.
„ 19. Mountain Pass in the Tyrol.
„ 20. Postwick Grove.

The price of the above Set is 17s. 6d.; by post, carefully packed in patent roller, 18s.

KINDLY ORDER EARLY, AS ONLY A LIMITED NUMBER OF PROOF COPIES CAN BE OBTAINED.

Through your Newsagent; Messrs. W. H. SMITH & SON'S Bookstalls; or from

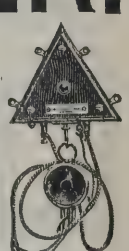
P. A. GILBERT WOOD, 175 STRAND, LONDON, W.C.

On the first floor will be office-room for cattle and horse associations, dog and pet-stock associations, and all remaining live-stock organisations. On the second floor will be an assembly hall, 172 feet long and 74 feet wide. Here the farmers will be given a chance to hold meetings. Special rooms are provided for the Farmers' Alliance, the National Grange and similar associations. The entire structure has been so planned as to give the farmers and live-stock men generally all they could ask in the way of accommodation at the World's Fair. The building will in form resemble the letter T, one portion being 500 feet long and the other 200 feet.

THE "ANTHYDOR" COMPOUND.

ATTENTION should always be called to a really serviceable material such as we believe the "Anthydor" Compound to be, and which will probably be most useful to many whose requirements will be better suited by using the Anthydor than any other of the excellent varieties of paints and covering compounds now in the market. The Anthydor, manufactured by the Anthydor Compound Company, Billiter Buildings, E.C., is an entirely novel substitute for oil-paints and distemper. Made in various tints the compound is intended for inside and outside work. The compound may be had washable or otherwise as ordered. It does not become discoloured as some compounds do, owing to changes resulting from the admixture of chemical agents. In many cases, especially in outside work, the washable Anthydor will be most useful as proof against weather and elements. In another form the compound can be removed without much difficulty if required. It may be as well to allude to the claims advanced by the company for the Anthydor. It is, they say, manufactured by a new process and of the best materials, and has proved to surpass in beauty, colour, covering properties and durability, all paints or distempers hitherto introduced. Another great advantage is that these compounds are absolutely lime-resisting, which, of course, is a very great feature. It is easily applied on any paper, inside and outside walls of all kinds, woodwork, iron, &c. It requires nothing added but tepid water to thin it down to the consistency of cream, and can be applied with either distemper or paint brushes, which it will not injure. It works like paint, and woodwork requires no special preparation beforehand. It is cheaper than wall-papers, dries smooth and bright, keeps its colour, and is most effective for high-class decorative work. It is claimed to be in every way much better than the ordinary distemper, which is known to be of a perishable nature and not at all conducive to health. It is a sanitary agent, is imperishable, and there is no decomposition whatever. It will keep any length of time. It is superior to all other distempers in its covering properties, as 1 cwt. will cover from 700 to 800 superficial yards. It is made for outside and inside walls and ceilings of public and private buildings, Government offices, banks, colleges, schools, warehouses, offices, railway stations, factories, workhouses, asylums, hospitals, churches, chapels, cottages, coachhouses, stables, laundries, &c. Its covering properties are much greater than oil-paint, it is more durable, damp-resisting, will keep its colour, thoroughly washable, is non-poisonous, works freely and smoothly, dries hard, does not blister or flake and will not crack with heat. It is superior to whitewash for ceilings and will cover paint and paper, and when varnished is more durable than oil-paint.

SANITATION OF ST. PETERSBURG.



THE unsatisfactory condition of the Russian capital in more than one respect is discussed by the British Consul there in his last report. Mr. Michell says that, according to the census taken in December 1890, the population, exclusive of the suburbs, numbered 956,226, being an increase of 31,760 as compared with 1889, and of 22,443 as compared with 1888. The rate of mortality is still abnormally high, owing chiefly to insanitary conditions. There is a total absence of sewers, their place being mainly taken by primitive cesspools and to some extent by rain-water drains, and the death-rate during the past five years has varied between 26·2 and 29·6 per 1,000. At the request of the Municipality, Mr. Lindley, C.E., drew up a plan of sewers for the whole town in 1880. It still remains under consideration. In addition to the sanitary disadvantages, St. Petersburg is frequently exposed to the danger of inundation during a prevalence of strong winds blowing from the west, south and north-west. Hardly an autumn passes without some of the low-lying suburbs being submerged to the depth of several feet, exposing the poorer classes of inhabitants, who occupy these parts of the town, to considerable danger, suffering and material losses. To prevent these it has been proposed to build a sea-wall from Oranienbaum, on the southern side of the gulf, to Lissy Noss, on the northern, leaving open the

present southern channel at Cronstadt. Such a wall would, it is said, by preventing a flow of water during westerly and south-westerly gales in the direction of the mouth of the Neva, effectually preserve St. Petersburg from being buried under the waters of the Gulf of Finland and partly those of the Baltic. The existence and imminence of the danger are exemplified by previous inundations, especially that which took place in 1824, when the water rose 13½ feet above its ordinary level. In 1691 the overflow is stated to have been still more serious, the water attaining a height of more than 15½ feet. During the past year there were two successive inundations in August, which at one time threatened to prove very calamitous. When the overflow had reached the height of 10 feet above the usual water-level the wind luckily subsided, and the water shortly regained its normal height. There is no indication at present of any intention to carry out the sea-wall referred to, the resources of the Government being already too heavily taxed for other and more pressing requirements.

RUSSIAN CHURCHES.

IT is the opinion of Professor Meiklejohn that influenza in Russia originates in the churches :—

I have just returned from Russia (he writes), and I think I can throw some light on the origin of the plague which has visited us during the last two years, and which wrought such havoc in the House of Commons. I believe I can also make a suggestion towards diminishing its ravages in this country. The most frequented buildings in Russia are the churches and cathedrals, and they are frequented by crowds of the poorest classes. They are "open" from morning till night; but this being "open" is strictly limited by the two or three doors which separate the porch from the main body of the building. The windows, too, are closed; they cannot be opened, and it is doubtful if a cubic foot of fresh air succeeds in making its way inside in the course of twenty-four hours. Just inside the doors the floor of the church is beset by a number of beggars infected with various kinds of loathsome disease. The air of these cathedrals is effete, dead, clay-cold, and especially in the corners and side-chapels. The air, such as it is, has been breathed over and over again thousands of times by the dirtiest and most depressed people in Europe, and hence it forms the appropriate *nidus* for the germs of such diseases as attack the mucous membrane and the breathing apparatus. A poison of the intensest virulence is brewed and rebrewed by the inhalations and exhalations of these miserable people. The *bis decies* distilled result is imported into this country by the steamers that carry the trade of the Baltic. You will remember that Hull was the first place attacked and that Parliamentary witnesses from Hull imported the disease into the House of Commons. Brewed in Russia, conveyed in Baltic ships, imported into Hull, distributed in the House of Commons—that is the short story of the Russian influenza.

Now the Houses of Parliament, considered as a whole, are not much better ventilated than the cathedrals of Russia. There are at present no means of sending a wave of fresh air through the various rooms in the building so as to clear out the poisonous germs that lurk in the numerous corners which are provided by its architectural structure. If a great sweep of fresh air could be driven through each room every morning, the dead atmosphere in which disease-germs grow and multiply would be expelled and the rooms would be tolerably healthy for the rest of the day. I have frequently observed the presence of dead air even in the lobby of the House of Commons, and, till this is remedied, there will always be a danger of the return of the influenza and other depressing diseases.

THE MANCHESTER SHIP CANAL.

A MEETING of the North-Western Branch of the Society of Medical Officers of Health has been held in Manchester, when a paper was read by Dr. Kenyon, Chester, entitled "Some Sanitary Notes on the Ship Canal." He said that the rapid concourse of such a large body of men as had been brought together for the construction of the gigantic work of the Ship Canal, and their residence for several years in temporary dwellings, afforded some material for the study of health problems. At any rate, it was worth while to put on record the experience, which was on the whole of a highly satisfactory nature. He would only refer to that part of the canal which was in his own district, and which included the important entrance works at Eastham and seven miles inland. The men were housed in excellent wooden huts clustered into villages. They were generally of one storey, with abundant cubic space and well lighted. Each house had several rooms, and was in charge of a married couple, who took a certain number of single men as lodgers. It was a peculiar fact, from a medical point of view, that in one of these villages, with over 100 houses,

there was for twelve months generally one hut with cases of scarlet-fever among the children, and yet the disease did not spread, although, beyond keeping the children from school, no special means of isolation were adopted, and the party walls between the huts had numerous chinks. He did not think that in any single instance did the infection find its way through the chinks so as to affect the children in the next house. There was always a fair space round the huts. At Ellesmere Port a convenient hospital was built, which proved extremely useful for cases of typhoid fever, of which, however, the number was not great. The moral was that with reasonable care, on practically new ground in the open country, it was possible to house a large but well-fed industrious population and keep them free from infectious disease. Of course the population in this case was a picked one, and everyone brought to the place as accessories—shopkeepers and the rest—was in a flourishing condition. The conditions, indeed, offered a marked contrast to those which obtained in slums. In the latter case it was not so much questions of drainage as the degraded character of the occupants of the houses which caused the high death-rate.

The Chairman said the experience on the Ship Canal was instructive. The buildings erected for the accommodation of the workmen were certainly not of a character that would be permitted in permanent structures. Nevertheless they had been inhabited for four or five years with fairly satisfactory results. No doubt the ventilation afforded by chinks and crevices gave the houses a great pull over those in stuffy courts and alleys in the large towns.

Dr. Vacher remarked that the results seemed to show that it was unwise to dogmatise on statistics gathered from small areas.

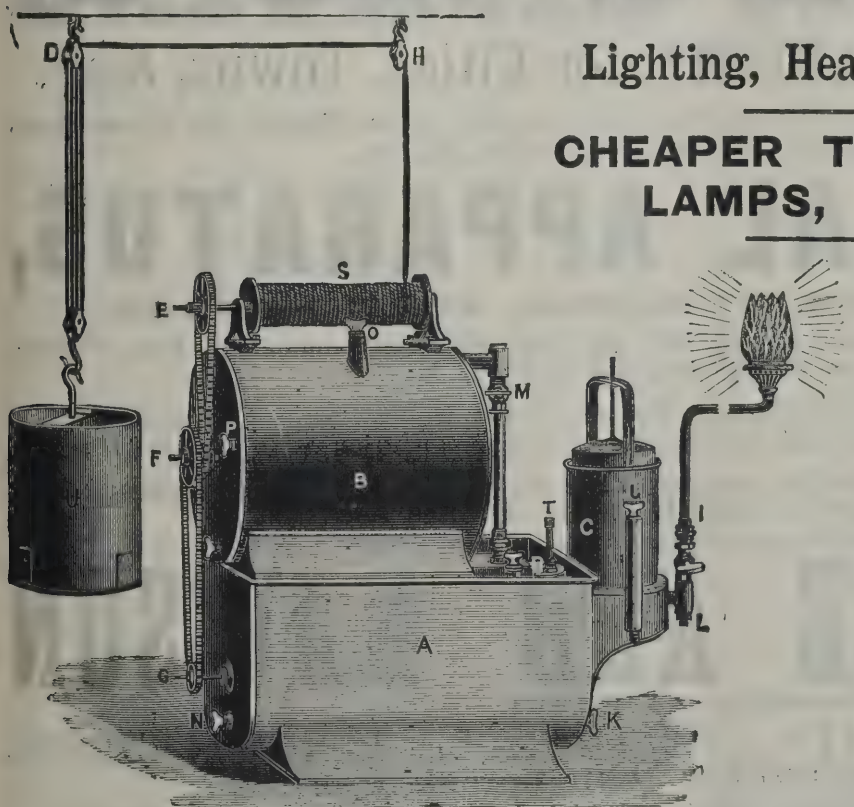
A vote of thanks was given to Dr. Kenyon for his paper.

ST. CLAIR TUNNEL.

In recording the opening of this tunnel the Philadelphia *Railway World* says :—This triumph of modern engineering has been achieved under the swift outlet of Lake Huron to supersede the ferry system of transporting the traffic of the Grand Trunk route from the American to the Canadian banks. Long ago the clumsiness of the ferries and particularly the exasperating delays in winter on account of ice-floes, made apparent the necessity for some surer and more expeditious means of interriparian transportation. A tunnel was considered least objectionable because the immense vessel interests were stoutly opposed to a bridge, on the ground that it would prove a hindrance and often a danger to navigation. But the nature of the sub-aqueous soil, clay and sand, made the feasibility of digging a tunnel a perplexing question. However, it was decided to make an attempt at constructing one. Two huge shields were started toward each other, one from the American, the other from the Canadian side. They bored their way, like mammoth moles, down under the river bed, curling their slow trails as they advanced until they met about under the middle of the river. It took twelve months to eat out the passage.

Three shields were made of heavy wrought-iron, with sharp edges, 15 feet 3 inches long and 21 feet 6 inches in diameter. Each shield was pushed forward by 24 hydraulic rams, the barrel of each ram being 8 inches in diameter, with a stroke of a little more than 18 inches. Each ram exercised a force of 125 tons.

The actual tunnel itself under the river is 6,026 feet long—over a mile. It is lined throughout with solid cast-iron plates bolted together in segments. Each segment is 5 feet long, 18 inches wide and 2 inches thick, with flanges 5 inches deep. The whole lining weighs 28,000 tons. The bolts and nuts for connecting the segments together weigh 2,000,000 lbs. The permanent way through the tunnel is laid with steel rails weighing 100 lbs. to the lineal yard. The interior diameter of the tunnel is 20 feet, and ample means have been provided for thorough ventilation and for lighting it throughout, when required, with electricity.



The road is practically level under the river, with approaches at each end under gradients 1 foot in 50. The total length of the tunnel end approaches is 11,553 feet—over two miles. At the ends of the approaches are junctions with the Grand Trunk Railway on the Canadian side and the Chicago and Grand Trunk Railway on the American side of the river. In connection with these junctions ample ground has been levelled and prepared, and 10 miles of shunting sidings have already been laid on each side of the river.

The cost of the tunnel proper was 1,460,000 dols. The Grand Trunk people believe that when the tunnel is in actual use it will offer facilities for through-communication between Chicago and all points east, which will be greatly appreciated by passengers in the palatial trains and freight shippers. It shortens the distance to the seaboard about 6 miles, and saves two hours in time.

THE "HELIOS" GAS-MAKING MACHINE

FOR

Lighting, Heating, and Motive Power.

CHEAPER THAN COAL GAS, OIL LAMPS, OR ELECTRICITY.

This Machine is the latest development of the Oil Gas systems. In most other such machines Gasoline is the gas-producing material, and as this can only be procured in large quantities, and is dangerous to store, there is naturally a great objection to its employment. The "Helios" Gas Machine is charged with Benzoline, which can be procured anywhere in large or small quantities. The Machine is simple, and the light produced far superior to coal gas. Machines made to supply from 6 to 2,000 lights.

Prices from £10 10s.

UNEQUALLED FOR

COUNTRY HOUSES, FACTORIES, HOTELS, &c.

BESSEMER IRON AND STEEL.

AT the last meeting of the Iron and Steel Institute Sir Henry Bessemer described an extension of his original process by which large plates as well as bars, rails and ingots can be produced. It is advantageous at such a time to study the original description of the Bessemer process by which, as was announced, malleable iron and steel can be produced without the direct agency of fuel. The following paper by the inventor was read at the meeting of the British Association at Cheltenham in 1856:—

The manufacture of iron in this country has attained such an important position that any improvement in this branch of our national industry cannot fail to be a source of general interest, and will, I trust, be a sufficient excuse for the present brief and, I fear, imperfect paper. I may mention that for the last two years my attention has been almost exclusively directed to the manufacture of malleable iron and steel, in which, however, I had made but little progress until within the last eight or nine months. The constant pulling-down and rebuilding of furnaces and the toil of daily experiments with large charges of iron had already begun to exhaust my stock of patience; but the numerous observations I had made during this very unpromising period all tended to confirm an entirely new view of the subject which at that time forced itself upon my attention, viz. that I could produce a much more intense heat without any furnace or fuel than could be obtained by either of the modifications I had used, and consequently that I should not only avoid the injurious action of mineral fuel on the iron under operation, but that I should at the same time avoid also the expense of the fuel. Some preliminary trials were made on from 10 lbs. to 20 lbs. of iron, and, although the process was fraught with considerable difficulty, it exhibited such unmistakable signs of success as to induce me at once to put up an apparatus capable of converting about 7 cwt. of crude pig-iron into malleable iron in thirty minutes. With such masses of metal to operate on, the difficulties which beset the small laboratory experiments of 10 lbs. entirely disappeared. On this new field of inquiry I set out with the assumption that crude iron contains about 5 per cent. of carbon; that carbon cannot exist at a white heat in the presence of oxygen without uniting therewith and producing combustion; that such combustion would proceed with a rapidity dependent on the amount of surface of carbon exposed; and, lastly, that the temperature which the metal would acquire would be also dependent on the rapidity with which the oxygen and carbon were made to combine, and consequently that it was only necessary to bring the oxygen and carbon together in such a manner that a vast surface should be exposed to their mutual action in order to produce a temperature hitherto unattainable in our largest furnaces.

With a view of testing practically this theory, I constructed a cylindrical vessel of 3 feet in diameter and 5 feet in height, somewhat like an ordinary cupola furnace, the interior of which is lined with firebricks, and at about 2 inches from the bottom of it I insert five tuyere pipes, the nozzles of which are formed of well-burnt fireclay, the orifice of each tuyere being about three-eighths of an inch in diameter; they are so put into the brick lining (from the outer side) as to admit of their removal and renewal in a few minutes when they are worn out. At one side of the vessel, about half-way up from the bottom, there is a hole made for running in the crude metal, and on the opposite side there is a tap-hole stopped with loam, by means of which the iron is run out at the end of the process. In practice this converting vessel may be made of any convenient size, but I prefer that it should not hold less than one, or more than five tons, of fluid iron at each charge. The vessel should be placed so near to the discharge-hole of the blast furnace as to allow the iron to flow along a gutter into it; a small blast cylinder will be required capable of compressing air to about 8 lbs. or 10 lbs. to the square inch. A communication having been made between it and the tuyeres before named, the converting vessel will be in a condition to commence work; it will, however, on the occasion of its first being used after relining with firebricks be necessary to make a fire in the interior with a few baskets of coke, so as to dry the brickwork and heat up the vessel for the first operation, after which the fire is to be all carefully raked out at the tapping-hole which is again to be made good with loam. The vessel will then be in readiness to commence work, and may be so continued without any use of fuel until the brick lining in the course of time becomes worn away and a new lining is required. I have before mentioned that the tuyeres are situated nearly close to the bottom of the vessel; the fluid metal will therefore rise some 18 inches or 2 feet above them. It is therefore necessary, in order to prevent the metal from entering the tuyere holes, to turn on the blast before allowing the fluid crude iron to run into the vessel from the blast furnace. This having been done, and the fluid iron run in, a rapid boiling-up of the metal will be heard going

on within the vessel, the metal being tossed violently about and dashed from side to side, shaking the vessel by the force with which it moves. From the throat of the converting vessel flame will then immediately issue, accompanied by a few bright sparks. This state of things will continue for about fifteen or twenty minutes, during which time the oxygen in the atmospheric air combines with the carbon contained in the iron, producing carbonic acid gas, and at the same time evolving a powerful heat.

Now, as this heat is generated in the interior of, and is diffusive in innumerable fiery bubbles through the whole fluid mass, the metal absorbs the greater part of it and its temperature becomes immensely increased, and by the expiration of the fifteen or twenty minutes before-named, that part of the carbon which appears mechanically mixed and diffused through the crude iron has been entirely consumed. The temperature, however, is so high that the chemically-combined carbon now begins to separate from the metal, as is at once indicated by an immense increase in the volume of flame rushing out of the throat of the vessel. The metal in the vessel now rises several inches above its natural level and a light frothy slag makes its appearance, and is thrown out in large foam-like masses. This violent eruption of cinder generally lasts about five or six minutes, when all further appearance of it ceases, a steady and powerful flame replacing the shower of sparks and cinder which always accompanies the boil. The rapid union of carbon and oxygen, which thus takes place, adds still further to the temperature of the metal, while the diminished quantity of carbon present allows a part of the oxygen to combine with the iron, which undergoes combustion and is converted into an oxide. At the excessive temperature that the metal has now acquired, the oxide, as soon as formed, undergoes fusion, and forms a powerful solvent of those earthy bases that are associated with the iron. The violent ebullition which is going on mixes most intimately the scoria and metal, every part of which is thus brought in contact with the fluid oxide, which will thus wash and cleanse the metal most thoroughly from the silica and other earthy bases which are combined with the crude iron, while the sulphur and other volatile matters, which cling so tenaciously to iron at ordinary temperatures, are driven off, the sulphur combining with the oxygen and forming sulphurous acid gas.

The loss in weight of crude iron during its conversion into an ingot of malleable iron was found on a mean of four experiments to be 12½ per cent., to which will have to be added the loss of metal in the finishing rolls. This will make the entire loss probably not less than 18 per cent., instead of about 28 per cent., which is the loss on the present system. A large portion of this metal is however recoverable by treating with carbonaceous gases the rich oxide thrown out of the furnace during the boil. The slags are found to contain innumerable small grains of metallic iron, which are mechanically held in suspension in the slags, and may be easily recovered. I have before mentioned that after the boil has taken place a steady and powerful flame succeeds, which continues without any change for about ten minutes, when it rapidly falls off. As soon as this diminution of flame is apparent the workman will know that the process is completed, and that the crude iron has been converted into pure malleable iron, which he will form into ingots of any suitable size and shape by simply opening the tap-hole of the converting vessel and allowing the fluid malleable iron to flow into the iron ingot moulds placed there to receive it. The masses of iron thus formed will be perfectly free from any admixture of cinder, oxide or other extraneous matters, and will be far more pure and in a forwarder state of manufacture than a pile formed of ordinary puddle-bars. And thus it will be seen that by a single process, requiring no manipulation or particular skill, and with only one workman, from three to five tons of crude iron passes into the condition of several piles of malleable iron in from thirty to thirty-five minutes, with the expenditure of about one-third part the blast now used in a finery furnace with an equal charge of iron, and with the consumption of no other fuel than is contained in the crude iron.

To those who are best acquainted with the nature of fluid iron it may be a matter of surprise that a blast of cold air forced into melted crude iron is capable of raising its temperature to such a degree as to retain it in a perfect state of fluidity after it has lost all its carbon and is in the condition of malleable iron, which in the highest heat of our forges only becomes softened into a pasty mass. But such is the excessive temperature that I am enabled to arrive at with a properly-shaped converting vessel and a judicious distribution of the blast that I am enabled not only to retain the fluidity of the metal, but to create so much surplus heat as to remelt the crop ends, ingot runners, and other scrap that is made throughout the process, and thus bring them without labour or fuel into ingots of a quality equal to the rest of the charge of new metal. For this purpose a small arched chamber is formed immediately over the throat of the converting vessel, somewhat like the tunnel head of the blast furnace. This chamber has two or more openings on the

sides of it, and its floor is made to slope downwards to the throat. As soon as a charge of fluid malleable iron has been drawn off fro m the connecting vessel the workman will take the scrap intended to be worked into the next charge, and proceed to introduce the several pieces into the small chamber, piling them up around the opening of the throat. When this is done he will run in his charge of crude metal and again commence the process. By the time the boil commences the bar ends or other scrap will have acquired a white heat, and by the time it is over most of them will have been melted and run down into the charge. Any pieces, however, that remain may then be pushed in by the workman, and by the time the process is completed they will all be melted, and ultimately combined with the rest of the charge, so that all scrap-iron, whether cast or malleable, may thus be used up without any loss or expense. As an example of the power that iron has of generating heat in this process, I may mention a circumstance that occurred to me during my experiments. I was trying how small a set of tuyeres could be used, but the size chosen proved to be too small, and after blowing into the metal for one hour and three-quarters I could not get up heat enough with them to bring on the boil. The experiment was therefore discontinued, during which time two-thirds of the metal solidified and the rest was run off. A larger set of tuyere pipes were then put in, and a fresh charge of fluid iron run into the vessel, which had the effect of e ntirely remelting the former charge, and when the whole was tapped out it exhibited as usual that intense and dazzling brightness peculiar to the electric light.

To persons conversant with the manufacture of iron it will be at once apparent that the ingots of malleable metal which I have described will have no hard or steely parts, such as is found in puddle iron, requiring a great amount of rolling to blend them with the general mass, nor will such ingots require an excess of rolling to expel cinder from the interior of the mass, since none can exist in the ingot, which is pure and perfectly homogeneous throughout, and hence requires only as much rolling as is necessary for the development of fibre ; it therefore follows that, instead of forming a merchant bar or rail by the union of a number of separate pieces welded together, it will be far more simple and less expensive to make several bars or rails from a single ingot ; doubtless this would have been done long ago had not the whole process been limited by the size of the ball which the puddler could make.

The facility which the new process affords of making large masses will enable the manufacturer to produce bars that on the old mode of working it was impossible to obtain ; while, at the same time, it admits of the use of some powerful machinery whereby a great deal of labour will be saved, and the process be greatly expedited. I merely mention this fact in passing, as it is not my intention at the present moment to enter upon any details of the improvements I have made in this department of the manufacture, because the patents which I have obtained for them are not yet specified. Before, however, dismissing this branch of the subject, I wish to call the attention of the meeting to some of the peculiarities which distinguish cast-steel from all other forms of iron, namely, the perfect homogeneous character of the metal, the entire absence of sand-cracks or flaws, and its greater cohesive force and elasticity as compared with the blister-steel from which it is made, qualities which it derives solely from its fusion and formation into ingots, all of which properties malleable iron acquires in like manner by its fusion and formation into ingots in the new process. Nor must it be forgotten that no amount of rolling will give to blister-steel (although formed of rolled bars) the same homogeneous character that cast-steel acquires by a mere extension of the ingot to some ten or twelve times its original length.

One of the most important facts connected with the new system of manufacturing malleable iron is that all the iron so produced will be of that quality known as charcoal iron, not that any charcoal is used in its manufacture, but because the whole of the processes following the smelting of it are conducted entirely without contact with or the use of any mineral fuel ; the iron resulting therefrom will in consequence be perfectly free from those injurious properties which that description of fuel never fails to impart to iron that is brought under its influence. At the same time, this system of manufacturing malleable iron offers extraordinary facility for making large shafts, cranks and other heavy masses ; it will be obvious that any weight of metal that can be founded in ordinary cast-iron by the means at present at our disposal may also be founded in molten malleable iron, and be wrought into the forms and shapes required, provided that we increase the size and power of our machinery to the extent necessary to deal with large masses of metal. A few minutes' such reflection will show the great anomaly presented by the scale on which the consecutive processes of iron-making are at present carried on. The little furnaces originally used for smelting ore have from time to time increased in size until they have assumed colossal proportions, and are made to operate on 200 or 300 tons of materials at a time, giving out 10 tons of fluid metal at a single run.

The manufacturer has thus gone on increasing the size of his smelting furnaces, and adapting to their use the blast apparatus of the requisite proportions, and has by this means lessened the cost of production in every way; his large furnaces require a great deal less labour to produce a given weight of iron than would have been required to produce it with a dozen furnaces, and in like manner he diminishes his cost of fuel blast and repairs, while he insures a uniformity in the result that could never have been arrived at by the use of a multiplicity of small furnaces. While the manufacturer has shown himself fully alive to these advantages, he has still been under the necessity of leaving the succeeding operations to be carried out on a scale wholly at variance with the principles he has found so advantageous in the smelting department. It is true that hitherto no better method was known than the puddling process, in which from 4 to 5 cwt. of iron is all that can be operated upon at a time, and even this small quantity is divided into homœopathic doses of some 70 lb. or 80 lb., each of which is moulded and fashioned by human labour, carefully watched and tended in the furnace, and removed therefrom one at a time, to be carefully manipulated and squeezed into form. When we consider the vast extent of manufacture, and the gigantic scale on which the early stages of progress is conducted, it is astonishing that no effort should have been made to raise the after processes somewhat nearer to a level commensurate with the preceding ones, and thus rescue the trade from the trammels which have so long surrounded it.

Before concluding these remarks, I beg to call your attention to an important fact connected with the new process, which affords peculiar facilities for the manufacture of cast-steel.

At the stage of the process immediately following the boil, the whole of the crude iron has passed into the condition of cast-steel of ordinary quality; by the continuation of the process the steel so produced gradually loses its small remaining portion of carbon, and passes successively from hard to soft steel, and from soft steel to steely iron, and eventually to very soft iron; hence at a certain period of the process any quality of metal may be obtained. There is one in particular, which by way of distinction I call semi-steel, being in hardness about midway between cast-steel and soft malleable iron. This metal possesses the advantage of much greater tensile strength than soft iron; it is also more elastic, and does not readily take a permanent set, while it is much harder, and is not worn or indented so easy as soft iron; at the same time it is not so brittle or hard to work as ordinary cast-steel. These qualities render it eminently well adapted to purposes where lightness and strength are specially required, or where there is much wear, as in the case of railway bars, which from their softness and lamellar texture soon become destroyed. The cost of the semi-steel will be a fraction less than iron, because the loss of metal that takes place by oxidation in the converting vessel is about 2½ per cent. less than it is with iron; but, as it is a little more difficult to roll, its cost per ton may fairly be considered to be the same as iron; but, as its tensile strength is some 30 or 40 per cent. greater than bar iron, it follows that for most purposes a much less weight of metal may be used, so that taken in that way the semi-steel will form a much cheaper metal than any we are at present acquainted with.

In conclusion, allow me to observe that the facts which I have had the honour of bringing before the meeting have not been elicited from mere laboratory experiments, but have been the result of working on a scale nearly twice as great as is pursued in our largest ironworks, the experimental apparatus doing 7 cwt. in thirty minutes, while the ordinary puddling furnace makes only 4½ cwt. in two hours, which is made into six separate balls, while the ingots or blooms are smooth even prisms, 10 inches square by 30 inches in length, weighing about equal to ordinary puddle balls.

TURKISH BATHS, WEST HARTLEPOOL.

These new baths have just been opened. The Turkish bath has become an institution in this country; a very large number of people use it as a luxury, as well as for purposes of cleanliness, besides being extensively used for remedial purposes. Many medical men are frequently found taking an active part in establishing Turkish bath companies and joining the board as directors. The Hartlepool Bath Company was formed to provide what was felt to be a pressing want. After purchasing the land, which was barely sufficient for their requirements, the directors consulted Messrs. J. Constantine & Son, of Manchester, as to the most economical mode of laying it out and providing the necessary baths, a Turkish and seven lounge baths, with all the necessary fittings to each. Every foot of land has been utilised, and a compact, complete and useful suite of baths has been provided. The building is good and substantial and of good design, and in its erection there has been no waste nor extravagance. It is doubtful if any town in Eng-

THOS. THOMAS & SONS, Acme Hoist Works, CARDIFF.

land has been provided with such a set of baths at the same moderate cost. Mr. Constantine, sen. (J. Constantine & Co.), patentee of the convoluted stove, has had over forty years' experience in working and fitting of baths, and opened baths in Manchester as far back as 1850. What was required was the effectual and economical heating and ventilation of the Turkish bath, and maintenance of a high, steady and uniform temperature at a cheap rate. The importance and the necessity was seen of a rapid and constant change of air in the hot-rooms, to carry away the effluvia from perspiration. The chief difficulty was the defective heating apparatus then in use. Several years' experiments resulted in the invention of the convoluted stove, which effected a saving of fully half the fuel. With the invention of this apparatus the heating and ventilation of the Turkish bath became at once a definite and reliable science. The necessary size and heating power of apparatus for the cubical area to be heated, the size of inlet flues for warm air and outlet for vitiated air, is a mere matter of calculation.

ST. BARTHOLOMEW'S HOSPITAL.

AT a meeting of the City Commission of Sewers on Tuesday, at which Mr. G. Manners presided, Dr. Sedgwick Saunders, the medical officer of health, reported upon the plans submitted for the approval of the Commission for the drainage of St. Bartholomew's Hospital by the governors of that institution. He said it was extremely gratifying to find that the authorities intended to divide their drainage system into three sections on precisely the plans suggested by him in his report. So far, therefore, as the general disposition of the sewage was concerned, the Commissioners might give the plans their cordial approval; but he thought the pipes to be used were in excess of present or future requirements, and might be reduced to one-third with advantage. He also took exception to the "man-hole" arrangements, which he considered too far from the main drainage, and the junctions of the pipes ought to be made accessible. It was proposed to remove all the old brick-sewers and to fill in and make good the cavities, and this was a matter which should be specially insisted upon. The engineer (Colonel Haywood) also approved of the plans, and the Commissioners passed them as satisfactory, and requested Colonel Haywood to see that they were carried out, with the various modifications and suggestions which he and the medical officer had pointed out.

BIRMINGHAM STONEMASONS AND SCHOOL BOARD CONTRACTS.

AT the meeting of the Birmingham Trades Council on Saturday evening the secretary of the Stonemasons' Society moved the following resolution:—"That after the information regarding the stonework of Rea Street Schools which has been given to the Sites and Buildings Committee of the School Board, this Council regrets to find that they have not done justice to the ratepayers of Birmingham by having the stonework properly executed according to specification; and that we request all our local governing bodies to insert a clause in all building contracts prohibiting sub-contracting; and, further, we call upon the working men of Birmingham to vote at every election against the candidate who will not give his adherence to such request." He said that for the extension of Rea Street School there were specified Stackstead stone for the steps and landings and Coxbench stone for the heads and sills. Having received information from men in his trade, he went over the building with Mr. Jephcott, a member of the School Board. As a stonemason, he instantly saw that the stones in the steps and landings were not Stackstead, while all the sills were of coarse Hollington stone instead of Coxbench. Mr. Jephcott communicated with Mr. G. H. Kenrick, chairman of the Sites and Buildings Committee. The consequence of that was the subcontractor was compelled to pull down the staircase. But he believed that although some Stackstead stone had been put in, some of the old steps had gone in again. The last time he went over the building with Councillor Stevens he found that the Hollington stone sills had not been removed, and since then other two representatives of his society had gone over the building and found that the Hollington sills still existed; that one of them was broken in two and patched with cement, and that another was pieced with shellac. They also found a landing with a patch of Portland cement as big as the palm of a man's hand, and a step chipped in such a way that any one who put his heel upon it would go to the bottom of the stairs pretty quickly. When he first went over the building the sills were neither one thing nor another; when he ran his eye along them they looked about as straight as a dog's hind leg. Since that time the sub-contractor had had masons at work upon them, and had made them a little bit better. It was the bounden duty of their public bodies to appoint men of every trade to supervise their building work. It was impossible for a carpen-

ter to understand stonework; a stonemason could not be expected to understand carpentry, and it was impossible for a bricklayer to understand either. Theoretical knowledge was not sufficient; there must be practical knowledge. The resolution condemned the system of sub-contracting. The practice of sub-contractors in the mason trade was to take jobs at prices at which honest builders could not compete with them. When the Victoria Courts were being built the contractor let the stonework to a Nottingham man, and this man used Shipley stone instead of the Green Moor stone that was specified. The Masons' Society communicated with the Corporation, and the sub-contractor had to put in the proper stone. Was it not time that they as trades unionists put an end to such things? There was nothing for it but to put an end to sub-contracting. In justice to the stonemasons of Birmingham he had felt bound to bring this matter forward. They had been told that stone would not stand in Birmingham. Was it likely, when stone not specified was put in, and when it was put in "bed-faced" instead of being put in as it grew in the quarry?

A member seconded the motion, and as one of those who had been over the Rea Street Schools endorsed the statements of the secretary. He also said that Stackstead stone was being introduced to prove that stone would stand as a building material in Birmingham. They were losing an honourable trade through the cursed way of doing business.

Another member said that a man had only to open his mouth loudly enough on a political platform to get appointed a clerk of the works in Birmingham. He believed that the reason why terra-cotta was pushed in Birmingham was that architects were interested in the sale of it. He should like to see a list of the shareholders in all the great terra-cotta companies published before the municipal elections.

Mr. Jephcott, as the member of the School Board with whom the secretary had communicated, explained the steps he had taken to bring the matter before Mr. G. H. Kenrick, the chairman of the Sites and Buildings Committee. In the last letter he received from Mr. Kenrick it was stated that the architects were disputing with the contractor the genuineness of the stone supplied, and that neither the steps nor the window-sills had been passed. Mr. Kenrick also said that he thought the architects could not be blamed for what had not yet been approved of by them. For himself, Mr. Jephcott said, he could not see how sub-contracting could be entirely done away with. According to the secretary, there were only four firms in Birmingham who could undertake the entire work of a building, and they could not very well limit public work to these four firms. Mr. Kenrick agreed with him in thinking that in all contracts the Sites and Buildings Committee should always hold the contractor responsible for all the sub-contracted work. One contractor should be responsible for the whole of the work. Another thing that was wanted was to have at least one labour representative on each of the spending committees. He had reason to believe that at least one would be placed on the Sites and Buildings Committee of the School Board after the election.

After some further discussion, the secretary said that the stone had been in the building three months, and it was time that the dispute was settled. A practical man could see at once that the stone was not what was specified. This was not the only complaint to be made about the building. He found in the basement about 18 inches of water, and was told that this was due to the foundations being below the height of the river Rea at the time they were laid. A cement casing, about a foot high and 1½ inch thick, had been put round the basement, but this was not a sufficient remedy. The water could run in and could not get out, so that whenever the river rose there would be water sapping the foundations.

The motion was carried unanimously.

PUBLIC WORKS IN GREENOCK.

THE annual statement has just been made by Provost Rodger on town improvements. He first referred to the proposed East-end Drainage Scheme, estimated to cost 7,650*l.* On account of its flatness, the ground in that part of the town was exceptionally difficult to drain. The Harbour Trust, through an overlook when their Bill of 1872 was passed, had found it impossible to implement obligations with regard to drainage placed upon them by that Bill. They could hardly go into a large scheme with the Police Board to drain the whole district, and the result was a compromise by which the Trust paid 1,500*l.* to the Police Board to get rid of the obligations. Besides, however, the Trust would have to pave the frontage as any other feuar, so that ultimately they would have to pay some thousands of pounds. Regarding the gradient, they had been told that a drain of this kind with a gradient of 1 in 600 would simply be a huge cesspool. As the question was discussed things had improved, and now they had agreed upon a gradient of 1 in 400, with flushing tanks on the upper streets to

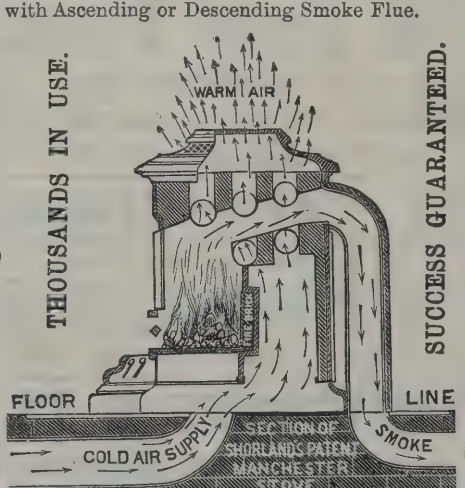
slush out the drain. On the question of the nuisance at Cartsdyke Harbour, it was proposed to carry an iron pipe further out, which, although it meant a little money, was a very simple matter; but it would improve the condition of the harbour, which was absolutely necessary. As to the Gas Trust, they were now putting in a new gas-holder at a cost of 6,000*l.*, and which would be finished at the end of this month. He was glad to be able to state that up till this date there had been, as compared with the corresponding period of last year, an increased make of gas representing 400*l.* It was most probable, therefore, that at the close of the year they would be able to reduce the price 2½*d.* per 1*l.*, or possibly something more.

BUILDING REGULATIONS IN GLASGOW.

THE New Buildings Regulation Bill drafted by the special committee of the Glasgow Police Commissioners appointed last spring in terms of a motion proposed by Mr. Ure Primrose for providing building regulations for the city and for other purposes has, the *Glasgow Herald* says, now been printed, and will be in the hands of the members of the Town Council in a few days. The committee have spent a great deal of time over the adjustment of the clauses, and we believe the Bill will be found to be a comprehensive and valuable measure. It opens with the usual defining and interpreting clauses. Next there is a provision empowering the Police Commissioners to make by-laws in connection with the various subjects embraced, and further, giving them authority to repeal and re-enact by-laws at pleasure, due notice being given by advertisement in two daily newspapers published in Glasgow. The clauses following relate to the powers of the Dean of Guild Court. It is provided that when decree of lining has been granted by the Court it shall be a depending process until the work sanctioned has been completed; and the Master of Works is authorised at any time to stop the work and request the intervention of the Dean of Guild Court; and a lining is not to be held as completed until a report is submitted by the Master of Works. In regard to noxious trades the Bill sets forth that the Dean of Guild Court shall not grant a warrant for the erection or the extension of a building for the carrying on of such trades without the consent of the Local Authority. The Master of Works, or any inspector appointed by him or by the Commissioners, is empowered to enter and inspect all buildings in course of erection or alteration, and likewise to enter all public buildings while open to the public, and any obstruction offered to such official renders the offenders liable in a penalty of 5*l.*

In the clauses relating to the laying out of new streets, it is provided that squares or parallelograms shall have through ventilation either by intersecting lanes or spaces left between the buildings at the corners of squares. A penalty is made exigible in the event of a barricade being continued on the street after the time granted by the Dean of Guild Court. Power is given to the Commissioners to construct and thereafter maintain bridges, tunnels, passages or subways, with the necessary accesses or approaches, over any street, and they may grant such power to any owner of lands and heritages fronting or abutting on any street. The height of a building is limited according to the width of a street, and it is proposed to enact that the building shall be measured, not from the top of the front wall as at present, but from the floor to the ceiling of the highest inhabited room or apartment in such building, or the top of the parapet, whichever may be highest. The amount of free space for dwellings and sleeping apartments is defined. Warehouses or tenements are limited to not more than 300,000 cubic feet of space between the walls. Any warehouse or tenement exceeding such space must be subdivided by party-walls.



The Dean of Guild Court has at present powers in regard to the size of the apartments in dwelling-houses. In the new Bill it is provided that in reducing by subdivision large-sized houses, houses of one apartment shall contain at least 1,000 cubic feet, two apartments 1,600 cubic feet, and three apartment 2,400 cubic feet, exclusive of lobbies, closets, presses and recesses. All sleeping apartments, except in attic-rooms, shall be at least 9 feet high from floor to ceiling, and every attic storey shall be at least 8 feet from floor to ceiling throughout at least one-half of the area of the room. In building or rebuilding dwelling-houses it shall not be competent to adopt such form of construction that more than sixteen separate occupancies shall enter from one common stair or passage, or more than twenty-four separate occupancies from one stair or balcony outside the tenement, or more than one house from one landing. Enclosed beds are prohibited. The master of works may by notice require the owner of any occupied building to make alterations so as to provide sufficient means of lighting, ventilation and drainage, and on failure of the owner to comply with such notice, the Dean of Guild Court is empowered to interdict the use of such building until effect is given to the terms of the notice.

Provision is made for the roofs of new buildings being con-

structed of non-combustible material, and at the end of seven years after the passing of the Bill all then existing buildings which do not comply with the terms of the Act shall be altered under penalty. The Court may grant exemption in regard to blocks of labourers' houses, hotels and public buildings generally. Wooden buildings or erections are prohibited, unless separated by a space equal to their height from any other building. Foundations must be laid to the satisfaction of the Master of Works of cube stones, concrete, bricks laid in cement or other suitable material. Chimney-stacks must be built as high as the chimney-top of any chimney within 100 yards distance, or the Dean of Guild Court may order such stack or flue to be carried up to a sufficient height to carry off the products of combustion without offence to the occupants of neighbouring buildings. Any person intending to add to the number of furnaces connected with a chimney must give notice of such intention and obtain a warrant from the Dean of Guild Court authorising him to do so. No building shall be occupied until the soil-pipes have been examined by the sanitary inspector and certified to the Dean of Guild Court as satisfactory. Water-closets must in future be placed in external walls of buildings, and must be sufficiently ventilated to the outside. Every closet must have a cistern distinct from the house-supply; the soil-pipes and waste water-pipes must not be connected but must be carried independently to the drains.

The chief officer of the Fire Brigade is empowered to remove dangerous buildings damaged by fire, to enclose and barricade streets, lanes and courts; and the expenses incurred in the execution of these powers are recoverable from the owners of the property. When a building, or part of a building, is occupied as a theatre, music hall, or for making, storing or selling hazardous goods, it is declared unlawful for any owner to let, or for any person to take a lease, or to suffer to be used as a dwelling-house any part of such building situated above such theatre or other premises, unless such dwelling-house is completely disconnected from the other parts of the building. This provision applies to all existing buildings not already occupied in the manner described, and on the expiry of seven years it shall be enforced in respect to all buildings in the city, non-compliance involving a penalty of 1*l.* per day.

Where a warehouse occupies more than two floors of a building, it is declared unlawful to have workrooms above the first storey in which more than ten persons are employed, unless such workrooms are provided with a separate passage or staircase giving access to the street or passage. Where more than forty persons are employed on an upper storey, or in a building the access to which is from a lower storey and not by separate stair, the occupier must provide at least two separate stairs or means of exit from such storey 25 feet apart. These clauses will apply to all buildings on the expiry of seven years after the passing of the Act, under a penalty the same as that in the preceding clause.

Every factory, mill, workshop or similar work which is more than one storey in height and 30 feet in length shall have an escape-staircase of fireproof construction placed not less than 5 feet clear of such factory or work, with a fireproof gangway from each floor of not less than 4 feet wide, and the doors of the gangway are to open outwards, and remain unlocked during the working hours. Every factory or workshop more than 80 feet in length shall have one escape-staircase and gangway for each 80 feet in length. It is declared to be unlawful to fit up on an upper floor of any new or existing building any steam-engine, gas-engine, boiler or heavy machinery unless such building is specially constructed for the purpose, or unless such engine or other machinery shall rest upon beams or columns of stone, brick or other incombustible material. Heavy machinery means machinery exceeding 280 lbs. per square foot of floor space occupied by such machinery. No theatre accommodating more than 1,000 persons shall, it is provided, be built unless it has free space on three sides of at least 15 feet in width, and sufficient means of egress into two streets.

When the Master of Works or any of his inspectors finds any operation in progress contrary to the Act or the Act of 1866, or of any by-law made in virtue of these Acts, they are empowered forthwith to stop such work, and to take precautions, by the appointment of a watchman or otherwise, that it shall not be resumed until such officer has had an opportunity of bringing the same before the Dean of Guild Court, and constables of police are to be bound to render the Master of Works or his inspector such assistance as he may require. Workmen contravening the Act or by-laws are to be liable to a penalty not exceeding 5*l.*

In the by-laws appended to the Act it is provided that no building shall be erected at greater height than the width of the street. Unless where the foundation of a building consists of sand, gravel, or virgin soil, it must be covered with a layer of concrete 6 inches thick. Clauses are inserted regarding the composition of mortar, concrete and other materials used in building. Projections abutting on the street are prohibited,

A High-class Sanitary Distemper for Outside and Inside Walls and Ceilings of Public and Private Buildings, Government Offices, Banks, Colleges, Schools, Warehouses, Offices, Railway Stations, Factories, Asylums, Hospitals, Churches, Chapels, Cottages, Coach Houses, Laundries.

ANTHYDOR COMPOUND CO.,

78 BILLITER BUILDINGS, BILLITER STREET, E.C.

except for architectural ornament. Balconies and platforms or galleries are not allowed over any window or sleeping apartment at a height of less than 12 feet above the floor of such apartment. In buildings one storey in height of stone or concrete the walls must be 16 inches thick; of two storeys, 18 inches; three storeys, 20 inches; four storeys, 24 inches. In buildings exceeding four storeys in height the thickness of each of the first two storeys shall be increased by 4 inches for each additional storey. In brick buildings of one storey the thickness shall be 9 inches; of two storeys—first storey 14 inches, second 9 inches; of three storeys—first 18 inches, the second and third 14 inches; of four storeys—first 22 inches, second 18 inches, and third and fourth 14 inches. In all the buildings above four storeys in height the thickness shall be increased by 4½ inches for each additional storey, and no part of the wall shall be less than 14 inches thick. Any wall more than one storey in height, or longer than 45 feet, or which is used as a bearing wall for a span more than 60 feet, shall be thicker to the extent of one-third than the several dimensions mentioned for an external wall of the same description. Iron columns shall be composed of malleable iron, or, if of cast-iron, shall be surrounded by plaster or cement. Openings in party walls must be secured with double iron doors, and the frames must be bolted through the walls. The gable wall of every dwelling-house must be carried 15 inches above the roof, and in warehouses 3 feet through the roof. Every hoist exceeding 6 square feet must be closed within incombustible walls, and must be carried through the roof to the extent of 3 feet, and the communicating doors on each floor must be of iron. The carrying timbers of buildings are increased from 30 to 50 per cent. Chimneys must be guarded with iron railings of suitable height. There are clauses relating to the insertion of timber near fireplaces and in regard to the alteration of chimneys originally erected for domestic purposes when used for ranges, hot-plates, ovens, or other commercial or manufacturing purposes. Other clauses provide for the construction of fireplaces and chimney-openings of incombustible material, and wooden mantelpieces must not project beyond the face of the jamb more than 1 inch for every 2 inches of vertical distance from the fireplace opening. Stoves, ovens or boilers used for the purposes of trade must not be placed on a wooden floor unless it is laid on a bed of concrete, brick or other incombustible material. Mansard roofs, or roofs steeper than 45 degrees, are prohibited in warehouses and business premises. Every owner desiring drains or pipes tested by the sanitary inspector must give a written notice to the inspector. Drains passing under dwelling-houses must be completely surrounded with Portland cement, and no drains or junctions connecting drain-pipes and plumberwork shall be covered up until after the owner has given the Master of Works three days' notice to enable him to examine and test the same. Only hard-metal gas-pipes are to be used in any new or existing building other than a dwelling-house. Provisions are also made regarding the safety of the public in connection with electric installation. Passages, corridors, staircases and stairs in all public buildings must be of stone or brick or other incombustible material, and must be so placed that from every part of the building there shall be easy exit. All stairs must have handrails on each side. Exits from public buildings shall be not less than 1 foot in width for every seventy persons who can be accommodated within the building. Provision is made for safe and easy exit for performers, and it is laid down that their dressing-rooms must not be of inflammable materials.

ROOF-DRENCHERS.

THE following statement appears in the *Glasgow Herald*:—

In an important commercial centre such as Glasgow anything which tends to minimise the risks of fire is deserving of earnest attention. As it happens, the proprietors of the *Glasgow Herald* have had only too good reason to dread the outbreak of fire which on three occasions within the last fifteen years has swept round their establishment. These perils have arisen not from any default of our own, but from the misfortunes of others. The greatest conflagration of this nature was that which occurred near the end of 1883 in Messrs. Wylie & Lochhead's premises in Buchanan Street. On that occasion the shooting flames and flakes overleapt and set fire to the roofs of the three buildings between Buchanan and Mitchell Streets, which together constitute the offices of the *Herald*. Hissing beyond, the flames communicated with a building in Mitchell Lane, which, like the huge pile belonging to Messrs. Wylie & Lochhead, was burned to the ground. The *Herald* buildings, thus threatened on both sides, and with the roofs actually alight, were saved chiefly through the well-directed energy of the employés, who used to good purpose the fire-extinguishing appliances always kept on the premises. In two other instances the establishment almost as narrowly escaped sharing to the full the calamities of its neighbours. This would seem to show

that the *Herald* offices bear a charmed life. It is pleasant to think so, but the argument is one which would avail little with an insurance company, and accordingly we have endeavoured so far as possible to reduce the risks which must be run by the adoption of all the latest appliances for the prevention and extinction of fire. The various departments have been fitted up with the Grinnell automatic sprinklers, consisting of pipes carried along the ceiling of every apartment, from which plentiful streams of water are at once released at an emergency. Outside the main building, and at a considerable height, a water-tower has been erected containing 3,500 gallons, always available, and in the machine-room, a little below the level of Mitchell Street, is a tank containing 3,000 gallons of water drawn from the street mains. This tank was originally erected for the supply of the Grinnell sprinkler installation, but has now the important auxiliary of a Worthington force pump, by means of which the water may be carried to the highest point of the building, or beyond it, at a minute's notice. While a good deal had been done in the direction indicated, the fact remained that our dangers in the past had always arisen from fire in adjoining properties being communicated to the roofs and windows of the *Herald* buildings. Mr. Alexander Sinclair, manager of the *Herald*, gave the subject long and anxious consideration, and in the end he devised a scheme at once simple and effective for drenching the roofs and exposed windows instantaneously and keeping them under flowing water for an indefinite time. As we have seen, there is an ample supply of stored water always at command. By the agency of the force-pump, which works automatically, the water is forced to the roofs, along the highest part or rigging of which, and also over all the windows, are carried malleable iron pipes, finished with zinc to prevent rusting and perforated every 3 inches to 18 B.w.g. In a few seconds after the water has been turned on the roofs and windows are drenched by an unbroken stream, and this, as we have said, may be maintained for any length of time, the 6,500 gallons in store being renewed as the flow proceeds. When the water has been turned off the pipes are run absolutely dry, so as to avoid the risk of freezing in cold weather. The roof-drenchers are used periodically to keep them at all times in perfect working order. So far as we are aware, no such method exists elsewhere of rendering fireproof the outsides of buildings, where, as our own experience has shown, the danger of borrowing a conflagration from one's neighbours is greatest. The roof-drenchers have been subjected to a practical test in presence of Lord Dean of Guild Guthrie Smith, Mr. Whyte, master of works; ex-Deacon Convener Mason; Mr. William Ure; Mr. David Dunlop, district manager of the Palatine Insurance Company; Mr. D. L. Laidlaw, general manager of the North British and Mercantile Insurance Company, &c. At the close the Dean of Guild, Mr. Whyte, and the other gentlemen expressed to Mr. Sinclair the greatest satisfaction with the results of the experiments. This system of roof-drenching, it may be added, has not been patented, and may be applied to places of business in the city.

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Cassell, Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.*]

APPLICATIONS FOR PATENTS.

16894. Edward Moloney, for "The drainage of damp basements of houses."

16929. Joseph Slater Lewis, for "An improved method of manufacturing metal window-sashes or frames."

16984. Reuben Robisher and Edwin Greenhalgh, for "Improved means for raising and lowering windows."

17006. Ivan Lange, for "Apparatus for sanding bricks and the like."

17025. Thomas Ledward, for "Improvements in bench and other vices."

17031. Mark Lawton, for "Improvements in sockets of window-fittings."

17100. Wm. Douslin, for "An improvement in mortice-locks."

17105. John Stephen Walley, for "The fastening of stable doors," and proposed to call "The Combermere patent combined lock and stable-door fastening."

17112. Peter Parker, for "An improved coffin-lid."

17176. Hugh Donald Fitzpatrick, for "Improvements in locks." (Hugo Steinke, Germany.)

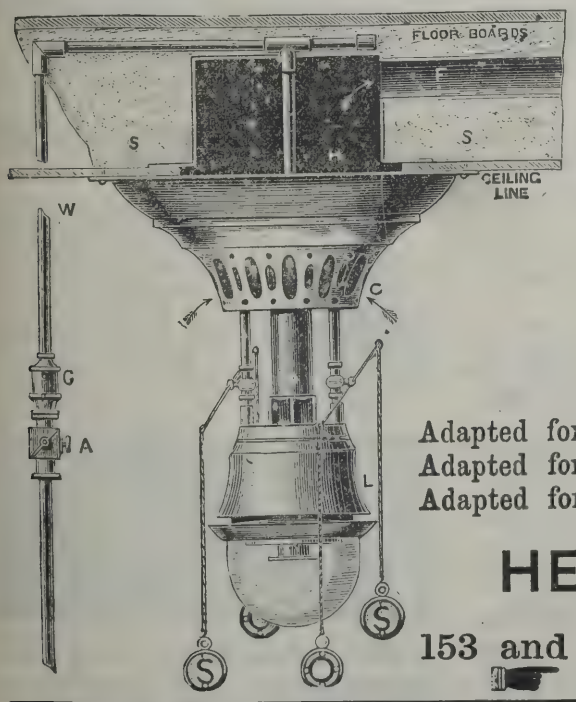
R. A. Ayles	50	0	0
R. A. Rendall (*accepted*)	49	15	0

TRADE NOTES.

Messrs. Gillett & Johnston, clock manufacturers and bell-founders of Croydon, have just succeeded in obtaining the order (in competition with some of the best firms in the country) for a large clock, to be constructed to strike the hours on a 20 cwt. bell, chime the Westminster quarters, and show the time on four 7 feet 6 inch dials, for Eastbourne Town Hall. The clock, &c., is to be of the best materials and workmanship, and to have all the latest improvements.



The tendering for the New Front Road improvements, Ramsgate, was of a very close character. With the exception of two tenders, which were evidently not meant for competition, they varied from 35,600*l.* to 45,948*l.*, the average of the whole being 39,801*l.*, against the engineer's (Mr. Wm. R. Valon) estimate of 39,149*l.* for this part of the work. This speaks well for the correctness of the drawings, specification and quantities. The engineer's estimate for the total structural

CASES FOR BINDING THE ARCHITECT.
Price Two Shillings.—Office: 175 Strand, London, W.C.

work was given in the first instance at 45,000*l.*, which sum was increased to 48,047*l.* at the desire of the quantity surveyors, Messrs. Hovenden & Berridge, so as to leave a safe margin. By the price of the accepted tender, however, it seems that the original estimate of the engineer will not be exceeded.

A LOCAL GOVERNMENT BOARD inquiry has been held at Kegworth by Major-General Carey, R.E., with respect to an application for sanction to borrow 5,000*l.* for sewerage and sewage disposal purposes. Mr. W. H. Radford, C.E., of Nottingham, is the engineer for the scheme, and he explained the plans. It is proposed to construct new pipe-sewers to deliver the sewage by gravitation to the sewage disposal site, where it would be pumped a lift of about 12 feet, and purified by broad irrigation on 8 acres of suitable land.

THE contract for the foundations for the Eiffel Tower, Blackpool, as we announced last week, has been let to Messrs. Robert Neill & Sons, builders and contractors, of Manchester. Their estimate, we learn, amounts to 2,447*l.* The architects for the work are Messrs. Maxwell & Tuke, 29 Princess Street, Manchester.

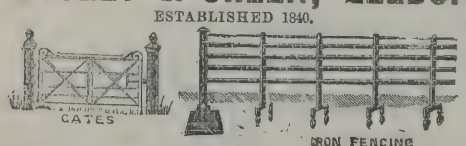
THE Electric Lighting Committee of the Glasgow Town Council, it is understood, have, on the recommendation of Sir William Thomson, decided to have a scheme of electric lighting on the "low-tension system" prepared for the city by Professor A. B. W. Kennedy, of London.

THE electric tramway along Roundhay Road, Leeds, which has been constructed by the Thomson-Houston Electric Company, has been satisfactorily tested. The formal opening was to take place yesterday.

A NEW clock has been supplied for the village of Hoyland, near Barnsley, manufactured by Messrs. Potts & Sons, Leeds. The clock shows the time on four illuminated dials 5 feet in diameter, made of skeleton cast-iron frames and glazed with white opal glass. The clock has four sets of strong dial or motion wheels for carrying the hands with double and single universal joints, all gun-metal or the best hard brass; four pairs of strong copper hands, correctly balanced or counterpoised within. The clock at Hoyland is from the designs and plans of Lord Grimthorpe, and is constructed on a solid horizontal cast-iron bed-frame, planed perfectly flat; all bushes are of gun-metal, screwed into the frame so that each or any wheel can be taken out separately if required in case of alteration or accident. The large main wheel of the going part has maintaining power attached to keep the clock going during the time of winding up. The clock has also Lord Grimthorpe's double three-legged gravity escapement, the finest improvement ever introduced for making a clock to keep correct time, and also compensated pendulum attached with heavy cylindrical-shaped bob, so that the clock will not be affected by any variations of temperature. The striking part, large or main wheels, has the necessary cams attached for lifting the hammer suitable for striking upon the fine bell in the tower, which bell is made of best bell-metal and weighs 4 cwts. The clock has also patent steel cords, cranks, levers, hammer, weights, block pulleys, bushed with brass and pivoted in, automatic gas apparatus for turning the light up or down according to the season of the year.

THE last of the series of massive iron girders and columns required for the colossal new holder now being constructed for the Westhoughton Gas Company at their works in Bolton Road, has been, the *Bolton Chronicle* says, fixed up. The holder-plates are being put together on the ground, and the whole work is expected to be completed, and the holder put in use, during December. It will have a capacity for storing upwards of 200,000 cubic feet of gas. The tank is 84 feet in diameter and 24 feet deep, and will require 3,000 tons of water to fill it.

IT was resolved at the meeting of the Gloucester City Council that, where practicable, city contracts should be given to local tradesmen, and that no contractor should be employed unless he paid not less than the maximum standard rate of wages, and that the Corporation should pay its workmen the standard wages.



A TRIAL is being made in Paris of a new system of wood-paving. It consists of pieces of oak about 4 inches long, split up similarly to the ordinary firewood, and laid loosely on end in fine sand on a bed of gravel from 4 inches to 4½ inches in thickness. A layer of fine sand is then spread over them, and they are alternately watered and beaten several times. In about forty-eight hours the humidity has completely penetrated and caused the wood to swell, and it is claimed that the mass becomes thus absolutely compact and homogeneous, and capable of supporting the heaviest traffic.

THE Cargofleet Iron Company, Limited, have been boring for some time in search of ironstone between the Whitby and Skelton roads, near Guisborough. They have proved a good seam of ironstone of varying thickness up to 11 feet, and arrangements will shortly be commenced for sinking a shaft.

THE personal estate of the late Mr. John M'Andrew, iron-founder, Glasgow, has been returned at 229,482*l.*

WOOD PAVING AND STEAM JOINERY WORKS
Clapham Junction, S.W

A NEW well and pumps have been inaugurated at Kidderminster. The well is sunk to a depth of 105 feet, and below that is a boring of 12 inches in diameter for a depth of 272 feet, and below that a further 6-inch boring to a depth of 246 feet, making a total depth of 623 feet. A connection is made with the old well by a heading 30 feet in length, in which a 24-inch iron pipe has been fixed, and a sluice-valve fixed so that the wells can be cut off from each other if required. The new engine-house is of red stock bricks, laid with encaustic tiles, and the engines are of the horizontal compound surface-condensing class of thirty nominal horse-power. The water is raised to the surface by a lift-pump 18 inches in diameter, and having a 4-feet stroke. When working at its maximum speed, it will lift 814 gallons a minute.

AT the meeting of the Worcester Watch Committee, Mr. Swete, electrical engineer, reported that he had canvassed the citizens of Worcester on the question of electrical works being established. His canvass had proved that a satisfactory demand for electric light and power existed, in that out of only 388 circulars distributed he received 189 replies taking up arc incandescent lamps or motors equivalent to 13,660 incandescent lamps of 10-candle power. He had but little doubt that if the inquiry were extended an equivalent to 16,000 lamps would be wanted.

AT the meeting of the Wolverhampton Town Council the tender of Mr. H. Holloway, amounting to 423*l.*, was accepted for the making of Bone Mill Lane between Ruckley siding and the pumping-station.

THE new workhouse infirmary, Grantham, is being warmed and ventilated by means of Shorland's patent Manchester stoves and exhaust ventilating shafts, the same being supplied by Mr. E. H. Shorland, of Manchester.

ZION CHAPEL, Neate Street, Camberwell, which had become very much dilapidated, has been thoroughly repaired, redecorated, lighted and well ventilated. The work has been done by Mr. E. F. Wells, builder and decorator, of The Crescent, Southampton Street, Camberwell, Messrs. Kite's automatic inlet ventilators being used. The walls are painted with damp-proof paint. The cornice round the chapel has been picked out in tints, and a stencil border over the dado all round the walls giving the place a very bright and cheerful appearance. The building has been heated by Wright's patent hot-air stove. A series of entertainments, commencing 31st inst., will be given every Saturday evening during the winter months, the proceeds to go towards paying off the debt incurred by the renovation of the building. Messrs. Neighbour & Cauldwell will superintend the entertainments.

THE Aberdeen County Council have approved of a recommendation to construct a bridge of stone at a cost of 1,260*l.*, in preference to iron at a cost of 935*l.*, over the Ythan at Boat of Ardlethen.

BUILDING AND BUILDERS.

PLANS for the theatre proposed to be erected at Llandudno by the Pier Company were submitted at this week's meeting of the Improvement Commissioners and sanctioned.

IT is rumoured, the *Glasgow Herald* says, that the Hydropathic Buildings, Oban, which have been in a ruinous condition for a number of years, have been acquired by an English syndicate, who propose to complete the buildings and convert a portion into an hotel and the remainder into residential flats.

THE corner-stone of a new tower for St. Michael's Church, Waddesdon, Bucks, has been laid. The old tower was built in the twelfth century. About 1,200*l.* has been obtained towards the 3,000*l.* required to complete the new structure.

IT is proposed to extend the Hospital Buildings of the Edinburgh Royal Infirmary so as to provide accommodation for 200 additional beds. The cost of the extension is estimated at 73,500*l.*, plans for which have been prepared by Messrs. Sydney Mitchell & Wilson.

AT the meeting of the Saltley Local Board, Birmingham, it was reported that during the year from March last plans for the erection of 158 dwelling-houses, one new works and for six additions to works and premises already erected, had been passed.

AT the monthly meeting of the Wrexham Town Council it was resolved to improve the Smithfield by the erection of covered sheds, with concrete floors, at a cost of 1,350*l.*

FIVE tenders have been received for building the Avonmouth Police Station. The lowest, that of Mr. James Greenslade, of Stroud, amounting to 1,887*l.*, has been recommended for acceptance.

AT a meeting of the Glasgow Police Commission the Watching and Lighting Committee reported that they had remitted to the city engineer and the inspector of fires to prepare an estimate of the cost of proposed buildings for a fire station

"SPHINX" PORTLAND CEMENT

112 lbs. per bushel. Slow setting; test 1,000 lbs. to 1¼ inch; seven days. Fineness, 2,500 meshes to square inch, with less than 10 per cent. residue. Over 10,000 tons supplied to Cardiff and Hereford Water Works.

Specially adapted for Concrete Floors and Street Paving.

"ECLIPSE" PORTLAND CEMENT

Quick setting; test, 3 parts. Standard Testing Sand, 230 lbs. per square inch; 28 days. The finest, most plastic, best sand carrying, and cheapest Cement in the market. Specially adapted for laying encaustic tiles, making joints in sanitary pipes, internal stucco, concrete foundations, &c.

Samples sufficient for Practical Tests Free. Manufactured by

JOHN BOARD & CO., Dunball, Bridgwater.

and for the accommodation of the lighting department on ground adjoining the Burgh Buildings at Maryhill. It was also recommended that new district fire stations should be erected on the site of the present police and fire stations, Old Keppechhill Road, and in the vicinity of Allison Street, Strathbungo.

PLANS for a new reception-house to be built at Clune Brae Foot, Port Glasgow, have been approved by the Dean of Guild Court. The reception-house consists of a one-storey building and attics, and has six rooms and kitchen. A separate building is to be erected, some yards apart, as a wash-house, with disinfecting-room. The buildings will be erected by Mr. Patrick Jamieson, at an estimated cost of about 700*l.*

THE Liverpool Dock Board have decided to spend about 152,000*l.* upon erecting several new sheds at the North-end, and a rubbish depôt and destructor at Hornby Branch Dock, the cost of the latter being estimated at 1,600*l.*

WITHOUT reflecting upon the faithfulness to duty of the Inspector of Buildings for the city of Toronto, it should be declared, the *Canadian Architect* says, that the inspection is a farce. Under present conditions it could be nothing else. During the present year the building restrictions which formerly applied only to the central districts have been extended so as to cover the whole city. Notwithstanding that the area covered by the by-law has thus been doubled, the building inspector is still expected single-handed to see that its provisions are complied with. Not only so, but he is saddled with other duties as well. The proper inspection of buildings in a large and rapidly-growing city like Toronto is in itself beyond the ability of a single individual to properly perform. As a result, the building by-law is being violated in all directions.

THE Emperor of Germany has inspected a model house in Berlin built by a company lately started for constructing dwellings for the working classes. His Majesty was so pleased with the dwelling in question that he ordered two such houses to be constructed for himself, which he will present to deserving workmen. These houses are small, self-contained, two-storey dwellings, and are let to workmen at a rent of 280 marks, or 14*l.* per annum. The payment of this sum, however, gradually enables the workman to become the owner of his dwelling.

IT has been decided to purchase for 450*l.* 3,200 square yards of land for the erection of a new police-station at Solihull.

AT Farnworth, during the demolition of the old Prestolee Chemical Works this week, one of the buildings collapsed, killing four men.

VARIETIES.

AT the last meeting of the Liverpool Health Committee for the present municipal year, Mr. J. B. Smith, the chairman, alluding to the engineer's department, said they had constructed during the year over three miles of impervious paving, and the total number of miles of this paving now was 101¼. Single-line tramways had been renewed for 794 yards; 3,584 yards of rail had been packed with liners which would make them last longer, and 318 yards of additional tram-lines had been laid. The sewers that had been constructed and reconstructed on the capital account were in length four miles, and there had been the usual work of cleaning and repairs. During the year 613 dwelling-houses had been erected. Under the Insanitary Property Act 215 houses had been demolished in the course of the year and other houses had been pulled down by the owners, but in regard to these the engineer had no record.

TWO memorial brasses have been uncovered in the south-east or Artists' Corner of the crypt of St. Paul's, to mark the place where Sir Edgar Boehm was recently buried. One is a massive and beautiful brass which covers the grave, and the other is fixed in the adjoining wall at the head of the tomb. The middle panel of the first brass contains a cross, with the name and date of birth, and the words, which were suggested by the Queen, "Died at his work."

THE restoration works at Crowland Abbey, which were suspended some time ago, are now again in active progress. Two of the arches which carry the steeple were in a most dangerous condition; these are being thoroughly restored. The beams which support the bell chamber have been found to be very much decayed and require under-beams to render them secure. The work of restoration was begun in 1888, and, although a great deal has been done, much more is required, including a new roof for the whole of that portion now used as a parish church.

THE Technical Instruction Committee of the Salford Town Council propose that application should be made to the Local Government Board for power to borrow 55,000*l.* for the purpose of the proposed technical school to be erected in Marlborough Square.

THE Coventry City Council have adopted a report by the General Works Sub-committee in reference to the sewage treatment and disposal difficulty, recommending that one or more competent engineers be consulted to examine as to the suit-

Fountain Street, Bury, and Shiffnall Street, Bolton:
February 13, 1891.

Gentlemen,—We have pleasure in announcing that we have opened extensive Show Rooms at 117 QUEEN VICTORIA STREET, LONDON (opposite Civil Service Stores).

We have been very successful in Lighting and Ventilating Public Buildings in all parts of the Country.

We have a large stock of Sunlights, Turrets, Exhaust Roof Outlets, Tobin's Tubes, Air Grids, &c., &c., at our Show Rooms.

We feel confident that our **DESIGNS**, as well as our system of Lighting and Ventilating will commend themselves to all who are interested in having BRILLIANTLY LIGHTED and WELL-VENTILATED ROOMS.

A visit to our Show Rooms will be esteemed a favour. If inconvenient to call, send for one of our Illustrated Catalogues, inspect our Designs, and read our Testimonials.

Trusting to receive your favours, which shall have our prompt attention,

We remain, Gentlemen, yours obediently, J. H. PICKUP & CO.

ability of land suggested; the works necessary for, and the cost of, a broad irrigation scheme; and generally to report upon the present system and works, and the manager's suggestions for enlargement and extensions.

New filters at Mill Glen Waterworks, Ardrossan, which have cost about 4,000*l.*, have just been opened. The contractor, Mr. Urquhart, of Glasgow, presented Provost Hogarth with a silver cup on the occasion.

At the meeting of the Lord Provost's Committee of the Aberdeen Town Council the question of providing public baths and wash-houses for the city was under consideration. It was agreed to instruct the town clerk to collect information as to the working of such institutions elsewhere.

The Sanitary Committee of the Wigan Town Council propose to borrow 15,000*l.* for the purpose of effecting sanitary improvements in the borough.

At a special meeting of the Newbury Corporation it was resolved that an engineer should be employed to advise as to which of three schemes submitted for the drainage of the borough should be adopted.

The portrait of Mr. Thomas Glenister, whose second year of office as Mayor of High Wycombe is drawing to a close, is given in the local *Standard* of the 23rd inst.

The *Indian Engineer* for September 26 has an article on Woodhouse & Rawson United, Limited, accompanied by a portrait of Mr. F. L. Rawson.

At a special meeting of the Town Council, Stoke-on-Trent, a resolution to promote a Bill in Parliament for powers to erect new gasworks to meet the future requirements of the borough was carried by eleven votes against six.

At the meeting of the Foleshill School Board the question of obtaining a loan for the erection of proposed new schools in Brick-kiln Lane was considered, and it was decided to accept 3,700*l.* from the Ecclesiastical Commissioners for fifty years, repayable by yearly instalments at 2*l.* 12*s.* 6*d.* per cent. interest per annum. It was further decided to hold a special meeting for the signing of the building contract.

A scheme is on foot for replacing the Queen's Ferry at Chester by a swing-bridge over the Dee. The estimated cost of a swing-bridge made of steel is 10,000*l.*, or, including approaches and contingent expenses, about 13,000*l.*

A paper on "Recent Practice in the Ironworking and Engineering Industries of the Cleveland and North-East Coast Districts," was read by Mr. Sidney H. Wells at the opening sessional meeting of the Yorkshire College Engineering Society, Leeds.

It has been decided to commence the construction of an underground lavatory on a first-class scale in Union Street, Aberdeen, being the first of a series to be constructed throughout the city.

At the quarterly meeting of the Warwickshire County Council, the following motion proposed by the Marquis of Hertford was agreed to unanimously:—"That this Council desires to express its deep sense of the loss sustained in the death of Mr. Francis Willmot, county surveyor, and its recognition of the able and satisfactory manner in which all his duties were performed."

It is proposed to affiliate the Dundee Institute of Architecture, Science and Art with the Royal Institute of British Architects. The membership of the Dundee Institute is likely to receive numerous accessions. Ladies interested in art are now also eligible as Associates.

During the municipal year the widening and straightening of the streets has been undertaken in Leeds to the extent of nearly 20,000*l.* of outlay. Under the head of street improvements no less than a score important thoroughfares are concerned. For the future it has been recommended that back streets shall be 18 feet wide, instead of 12 feet as before, and that the main streets shall extend for 14 yards or more from building to building, instead of 12 yards as at present. During the next municipal year the paving to be done will reach to a length of five miles, no less than eighty streets having been placed on the list for such treatment.

According to the *Pall Mall Gazette*, it is proposed to connect Waterloo Station with the City by means of a subway, on which electric trains would be run.

Complaints have been made that the London County Council, in repairing the carriage-way of the Thames Embankment, have, contrary to the custom hitherto, shut up the whole width of the thoroughfare, and thereby caused great inconvenience and congestion of traffic in Fleet Street and the Strand.

Another volume of the *Magazine of Art* is begun with the November number. The new features introduced for the first time are those of a frontispiece in colours ("A Breezy Day," by H. Detmold), and the monthly paper, entitled "Our Illustrated Note-Book," wherein subjects pictorial, architectural, sculp-

tural, &c., are placed before the reader in a manner not hitherto attempted in the magazine, and by means of which the art movement of the day will be kept up to date by pictorial as well as by descriptive illustration.

THE Christmas number of the *Art Journal* consists of a life of the well-known artist, Briton Riviere, R.A. The blocks and paper are printed in the best style imaginable, and the full-page illustrations are *par excellence*.

THE fourth season of the "A.A." Lyric Club was inaugurated by a smoking concert held at the headquarters, Mona Hotel, Covent Garden, on the 23rd inst. The programme arranged by the president, Mr. A. C. Bulmer Booth, was most successfully carried out, Messrs. Booth, Hunter, Smith, Perks and Captain Watson contributing songs, and Messrs. F. T. W. Miller and Perks recitations. Mr. C. D. Imhoff again proved a most efficient accompanist. The next concert takes place on November 20, and will be arranged by Mr. Earle, who promises a performance by the "A.A." String Band and other special items.

"A ROYAL DIVORCE" at the New Olympic Theatre has proved so successful that the manager, Mr. W. W. Kelly, has renewed his tenancy of the said theatre, and been obliged to cancel the provincial tour he had already booked for Miss Grace Hawthorne. The cast of "A Royal Divorce" has been greatly strengthened by the special engagement of Mr. Hermann Vezin, who will appear as "Napoleon" on and after to-morrow, Saturday.

AMERICAN NOTES.

THE New York correspondent of the *Standard* says:—The basis of Mr. Villard's plans for introducing electricity as the motive power upon the Northern Pacific Railway is Mr. Edison's invention, which has hitherto been regarded only as adapted to tramways. Mr. Edison asserts that three stationary engines will be adequate to the traffic on the Pennsylvania Railway between New York and Philadelphia at whatever speed may be desired. He seriously proposes during the World's Fair to run trains, say, at twenty minute intervals, between Chicago and Milwaukee. Details are withheld, but it is known that Mr. Edison uses neither a trolley nor a storage battery, the currents passing over the rails, and safety being secured by a pressure so low as scarcely to produce an appreciable shock.

AT a meeting of the Manchester Association of Engineers, Mr. Hans Renold described a visit recently paid by him to some leading American workshops. He went to America, he said, with very high expectations as to the wonderful engineering work he would see, and he confessed that what he saw far surpassed his expectations. At a shop he visited in Boston, for example, he saw patent milling cutters being made at the rate of sixty-four per hour by a dozen men: 1*l.* spent in wages produced 30*l.* to 40*l.* worth of goods. Tools were stored in safes as carefully as if they were worth their weight in gold. He was much struck with the clean, healthy appearance of the men. He thought that perhaps one secret of the success of the machine trade in America was the extent to which specialisation was carried. Yet another reason was that in comparison with the Americans we were lacking in capital. There was money enough to be found in this country for a Canadian railway or for a South American railway, or for a gold mine which existed only in the imagination of the company promoter, but in Manchester, for example, it was impossible—he spoke from experience—for a man with some brains to raise 200*l.* or 300*l.* to work with. This was not as it should be. In America, as it seemed to him, engineers put their savings into their businesses, for the purpose of improving and extending them, to a greater extent than we did in this country.

IT has been arranged that a sum of about 2,000,000 dols. are to be devoted out of the estate of the late Mr. Tilden, for providing a library for New York, in accordance with the wishes of the deceased gentleman.

CHICAGO EXHIBITION NOTES.

PENNSYLVANIA'S exposition building will cost 75,000 dols.

INDIANA will have a 100,000-dol. building at the Fair. It will not cost that much, however, as a large share of the material, all of which will come from that State, will be donated.

SOUTH DAKOTA is raising 80,000 dols. for its representation at the exposition. It proposes to erect a building 144 feet square.

CONTRACTS for the construction of the Government's exposition building have been let to four firms—three in Chicago and one in Indianapolis—for different parts of the

work. The aggregate amount of these contracts is 316,757 dols. which is less by 22,000 dols. than any single bid for the entire work.

The owners of one of the finest business corners in Chicago have decided to erect a 1,000,000-dol. sixteen-storey building, to be called "The Columbus," in honour of America's discoverer. The plans contemplate a structure strikingly artistic and ornate in appearance, of the Spanish style of architecture.

France has asked 25,000 and The Hague 11,000 square feet of space for their picture exhibits.

NEW CATALOGUES.

Church Furniture.—The catalogue of Messrs. West & Collier, of Hambleden, Henley-on-Thames, shows a fine assortment of church furniture, as manufactured by the firm in wood. It comprises fifty pages filled with illustrated designs of altars, lecterns, pulpits, litany desks, sedilias, choir and nave seats, church chairs, Glastonbury chairs, credence tables, altar crosses, &c. Attention is also given to the minor articles of church furniture, too numerous to mention, but among which are candlesticks, alms-boxes, collection-plates, &c., and umbrella stands. Exterior requirements are also dealt with, such as lych gates, churchyard gates, &c. The designs, Messrs. West & Collier wish it to be understood, in no way embrace the full extent and variety of their manufactures, and they will be pleased to forward other illustrations if purchasers will state the purpose for which the goods are required. More than enough, however, will be found in the catalogue to show the excellent style of work produced by Messrs. West & Collier.

We have received some price-list sheets issued by Mr. W. F. Stanley, of Great Turnstile, Holborn. Stanley's black drawing ink is well known in the offices of architects, engineers, surveyors, builders, &c. In manufacturing this the aim has been to produce a pure fluid black ink, entirely free from sediment, and an ink that should be perfectly permanent and unaffected by acids and alkalies. The drawing inks also include those in blue, red, green, orange and brown. Details also are given of Stanley's patent fluid professional colours, the use of which saves much time in colouring sections and details, and represent the materials to be employed—stone, brick, wood and metal. A time-saving appliance is "Gravet's Calculating Rule" for the use of architects, engineers, electricians, scientists, &c. Professor Fuller's Calculating Slide Rule is, it is stated, believed to be the simplest yet made to facilitate the numerous arithmetical calculations constantly required in office work. Stanley's "Treatise on Surveying and Levelling Instruments," written by the light of long experience, is for practical men more valuable than anything of the kind yet attempted, and has already been noticed in *The Architect*.

THE BREWERS' EXHIBITION.

A show, remarkable as well for its great variety as for the breadth of its interests, is now in progress at the Agricultural Hall, Islington, where is being held the thirteenth annual exhibition and market of the brewers and allied trades. No industrial exhibition at this hall has probably ever been so well attended, and as far as exhibitors are concerned, a great number, we hear, have had to be refused space, owing to all the available space being filled up at the outset.

The following firms, whose names we mention as likely to be of most interest to our readers, are exhibitors:—The Campbell Gas-Engine Company, of Halifax and London, varieties of gas-engines; Llewellins & James, brewers' engineers, Bristol, among other articles Day's patent gas-engine; Dan Rylands, Ltd., Barnsley and Manchester, glass tubing, which is invaluable in a sanitary sense, as a preventative of metallic contamination; C. Isler & Co., so well known for artesian bored tube wells, driven tube wells (supplied to the War Department), well-boring apparatus, Isler's patent registering turnstiles, &c.; Le Grand & Sutcliffe, their well-known artesian tube wells, pumps, driving apparatus (Norton's patent), boring tools, deep well pumps and registering turnstiles; F. Whitfield & Co., Birmingham and London, fire and thief resisting safes; H. Greene & Sons, gas engineers, Cannon Street, E.C., gas lamps, gas kitcheners, electric light fittings, general gasfittings and sundry novelties; James Stiff & Sons, Lambeth, stoneware bottles with tapholes and large stoneware screw stoppers; Sutcliffe, Wright & Son, Halifax, measuring and checking taps, measuring and recording (tell-tale) taps and "Empress" froth-pigs. William Bradford, architect and brewers' consulting engineer, Carlton Chambers, Regent Street, perspective drawings of breweries and maltings; Bradford's patent plastic malting floors; Bradford's patent cowl for malt kilns, &c.; E. S. Hindley, Bourton, Dorset, engineer, steam engines with and without boilers; Blackman Ventilating Company, Fore Street, E.C., the electric Blackman,

ELECTRIC LIGHTING
By CENTRAL STATIONS, for Cities, Towns, &c.
And Electric Transmission of Power carried out in any part of the World, for Tramways, Light Railways, Gold Mining Plant, &c. &c.

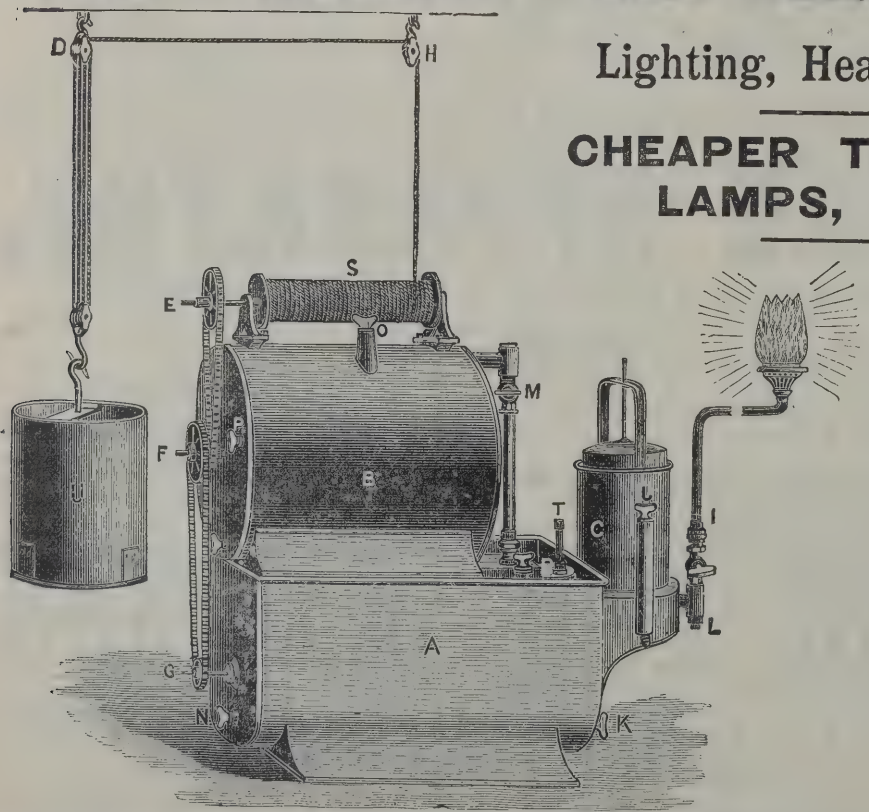
Isolated Plants for Lighting Country Mansions, Houses, Shops, Offices, &c. Estimates Free.
Electric Bells fitted to Hotels, Houses, Lifts, Clubs, &c. Experienced Engineers sent to all parts.
The "Diamond" Quick-Break SWITCHES. Largest Sale in the World. Best Make throughout.
The "Diamond" Single-Coil ELECTRIC BELL. Price only 3s. each.
WOODHOUSE AND RAWSON
UNITED, LIMITED,
ELECTRICAL AND GENERAL ENGINEERS,
CONTRACTORS, FOUNDERS, AND BOILER MAKERS,
HYDRAULIC MACHINERY of all kinds. Makers of Electrical Apparatus of every description.
Head Office:—88 Queen Victoria St., London, E.C. Show-rooms:—34 Cannon St., E.C.
Works:—London, Manchester, Kidsgrove and Chiswick.

or Blackman fan and motor combined; Easton & Anderson, Limited, Erith and London, dynamos, electric lighting apparatus, &c., combined high-speed engine and "Whitehall" dynamo (Prentice's patent), and 30-light "Whitehall" dynamo, &c.; Weyman & Co., engineers, Guildford, gas-engines; Ewart & Son, Euston Road, lightning geysers; Ewart's gas-controllers; Bostwick Gate and Shutter Company, Limited, Queen Victoria Street, E.C., patent steel folding gates and shutters; Hudson & Kearns, Southwark Street, Garland's patent numerical register; D. Hulett & Co., Limited, High Holborn, gasfittings, lamps, window-rails, &c.; J. H. Heathman & Co., Endell Street, W.C., fire-hydrants, portable fire-extinguishing appliances, hose for brewers' racking (Heathman's special antimonial), valves, couplings, cocks, &c., brewers' fittings, &c.

THE MERSEY AQUEDUCT.

A REPORT has been prepared by the chairman and deputy-chairman of the Water Committee of the Liverpool Corporation upon the contract of Messrs. John Cochrane & Sons for the construction of the aqueduct tunnel under the Mersey. In consequence of the sad death of Mr. John Cochrane, an investigation into the affairs of the firm was necessary, and the result, so far as the contract with the Corporation is concerned, is exhaustively set forth in the report. The contractors undertook to construct the tunnel shafts and pipe-laying for 12,000*l.*, plus the cost of such castings and ironwork as might be necessary, over and above those taken over by the Corporation from Messrs. Monk & Newell. The estimated cost of these additional castings and ironwork was about 4,000*l.*, thus making the total cost of the works under the contract 16,000*l.* At the commencement of the contract the contractors deposited with the Corporation 1,500*l.* in lieu of providing sureties, and that sum was now in the hands of the Corporation. Up to September 24 last (the date of the last certificate granted by the engineer) the contractors, according to their own statement, had spent the following sums, viz.:—Plant and stores, 8,403*l.* 18*s.* 4*d.*; wages and salaries, 6,665*l.* 18*s.* 11*d.*—15,069*l.* 17*s.* 3*d.*; castings and ironwork, 3,158*l.* 3*s.* 7*d.*; total, 18,228*l.* 0*s* 10*d.* They had received under the engineer's certificates the following sums, viz.:—For work executed, 2,618*l.* 3*s.* 6*d.*; for castings, 1,685*l.* 4*s.* 3*d.*; total, 4,303*l.* 7*s.* 9*d.*; thus showing a sum of 13,924*l.* 13*s.* 1*d.* as the amount which they are out of pocket in expenditure on the works up to September 24 last. As a set-off against this loss is the retention money, amounting to 1,075*l.* 16*s.* 11*d.*; cost of castings on the ground, but not yet paid for under the certificates, 1,041*l.* 13*s.* 4*d.*; total, 2,117*l.* 10*s* 3*d.*; which, if paid to the contractors, would reduce their loss to 11,807*l.* 2*s.* 10*d.* The work done by the contractors comprises the Lancashire shaft and 185 feet of the tunnel, and on the Cheshire side the shaft had been sunk to the required depth. The work remaining to be done was the completion of the shafts and the driving and lining of 620 feet of the tunnel. The contractors have been relieved from their obligations under the present contract, and a new arrangement has been entered into whereby the contractor has assigned over to the Corporation the retention money of 1,075*l.* 16*s.* 11*d.*, the deposit of 1,500*l.*, and all plant, machinery and implements now on the works in which they have any interest. Although the chairman and deputy-chairman recommended that a new contract be entered into with the surviving partners of the firm of John Cochrane & Sons, the work will practically be done by the Corporation, who are retaining the staff of men now on the works. These men are to be under the constant supervision of Mr. Arthur Cochrane, who is to receive the sum of 5*l.* per week towards his personal expenses so long as he resides near the works. The work is to be completed under the directions of the engineer, Mr. Deacon.

THE LATE MR. GEORGE SIBLEY.



THE death is announced of Mr. George Sibley, C.I.E., Memb.Inst.C.E., F.R.G.S., on Sunday last, at his residence, The Mount, Whitehill, Caterham, at the age of sixty-seven. He was educated at University College School, London, from 1831 to 1836. On leaving school he served the usual period of apprenticeship with his father, who was an architect and civil engineer in London. In 1845 he was employed upon the Bristol and Exeter Railway, under Mr. Brunel, and afterwards under Sir Charles Hutton Gregory. In 1851 he went to India, and was engaged upon the East India Railway, under Mr. James Meadows Rendel. He gradually worked his way up, and in 1859 became the chief engineer of the North-Western Provinces Division, and in 1868 chief engineer of the whole line of 1,500 miles. He retired from the service and from the profession in January 1876. Among the more important works constructed under his supervision may be mentioned the Jumna Bridge, Allahabad, which was completed in 1866, and was, at

THE "HELIOS" GAS-MAKING MACHINE

FOR

Lighting, Heating, and Motive Power.

CHEAPER THAN COAL GAS, OIL LAMPS, OR ELECTRICITY.

This Machine is the latest development of the Oil Gas systems. In most other such machines Gasoline is the gas-producing material, and as this can only be procured in large quantities, and is dangerous to store, there is naturally a great objection to its employment. The "Helios" Gas Machine is charged with Benzoline, which can be procured anywhere in large or small quantities. The Machine is simple, and the light produced far superior to coal gas. Machines made to supply from 6 to 2,000 lights.

Prices from £10 10s.

UNEQUALLED FOR

COUNTRY HOUSES, FACTORIES, HOTELS, &c.

FOR FURTHER PARTICULARS APPLY TO

THE INCANDESCENT GAS LIGHT CO., LIM.,

14 PALMER STREET, WESTMINSTER, LONDON.

that time, the largest bridge existing, being supported on fourteen piers, and having a railroad above and a carriage and footway beneath. Mr. Sibley was a great traveller, and there are but few parts of the world, even those remote and uncivilised, that he had not visited at some period or other in his life. He made various contributions to scientific, engineering and geographical journals, and it is understood that he has left a considerable legacy to the University of Calcutta for the purpose of founding engineering scholarships, and for other ways for the encouragement of native engineering students.

THE CHICAGO EXHIBITION, 1893.

THE following prospectus has been issued by the Royal Commission for the Chicago Exhibition—the Council of the Society for the Encouragement of Arts, Manufactures and Commerce :—

Under date of August 27, 1891, Her Majesty was pleased to issue a commission to the Council of the Society of Arts authorising them to act as Commissioners for the Universal Exhibition, which, pursuant to an Act of Congress, and in accordance with a proclamation made by the President of the United States of America, will be held at Chicago from May 1 to October 30, 1893.

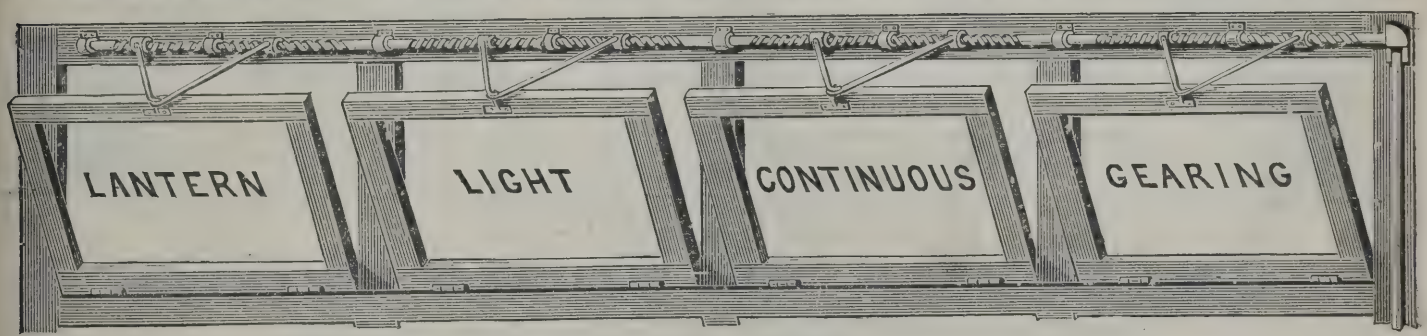
The Royal Commission are now prepared to receive applications from artists, manufacturers and others desirous of taking part in the exhibition, to afford them all necessary information, and to offer them all available facilities which they may desire for this purpose.

Such applications must be made upon forms to be obtained from the secretary of the Commission, at their offices, Society of Arts, John Street, Adelphi, London, W.C. They must be sent in, properly filled up, not later than February 29, 1892, and addressed to the secretary as above.

As the funds granted by Her Majesty's Government will not suffice to defray all the expenses of the section, it is necessary that they should be supplemented by payments from the exhibitors. A charge will therefore be made to each exhibitor, based on the amount of space occupied, and calculated on the following scale :—For spaces not exceeding 100 square feet, 5*s.* per square foot ; for spaces exceeding 100 square feet and not exceeding 200 square feet, 4*s.* 6*d.* per square foot ; for spaces exceeding 200 square feet and not exceeding 300 square feet, 4*s.* per square foot ; for spaces exceeding 300 square feet and not exceeding 500 square feet, 3*s.* 6*d.* per square foot ; for spaces exceeding 500 square feet and not exceeding 750 square feet, 3*s.* per square foot ; for spaces exceeding 750 square feet and upwards, 2*s.* 6*d.* per square foot. The minimum charge will be 5*l.*

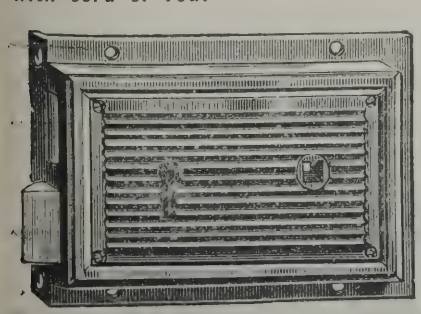
It is not expected that the total receipts from all sources will more than suffice to defray the cost of an adequate representation of British industry ; but should there be a sufficient surplus after the payment of all the costs of the section, the Royal Commission will refund the balance *pro ratâ* with the amounts contributed by the several exhibitors. The amount produced by the payments of exhibitors will therefore be treated as a guarantee fund, to be expended if necessary, but if not, to be refunded to the contributors.

The exhibition is situated in Jackson Park, within the southern limits of the city of Chicago. The principal buildings are devoted to the following main divisions :—(1) Fine arts ; (2) manufactures and liberal arts ; (3) agriculture ; (4) machinery ; (5) electricity ; (6) mines ; (7) transportation ; (8) horticulture. In all these space has been allotted to Great Britain, though it is expected that the principal British court will be that in the building of manufactures and liberal arts, since the privilege has been conceded to this country of massing all or most of its exhibits together, should such a course prove desirable.

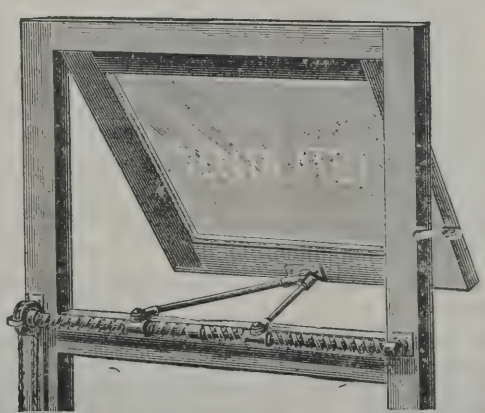


Exhibitors' goods will be transmitted direct in bond to Chicago, where the usual Customs examination will be made. Goods for exhibition only will not be liable to duty, but on goods sold the usual rates will have to be paid. Goods can be sold in bond, at prices independent of tariff, the duties being payable by the purchaser.

The American railroad companies propose to carry goods back from the exhibition free, charging the usual rates for the outgoing journey. These rates, it may be noted, are low in comparison with those usual in European countries. It is hoped that special terms for exhibition goods traffic may be obtained from the Atlantic steamship companies. Full information as to routes, traffic, rates, &c., will be provided in due course.



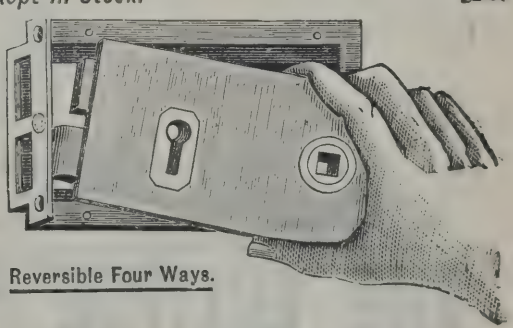
A general official catalogue will be published in English, French, German and Spanish. A special catalogue will also be published for the British section.



Exhibitions of live-stock will be held, and prizes will be offered in connection with them. A special circular has been issued giving information about these.

JAMES HILL'S PATENT
FANLIGHT OPENERS & REVERSIBLE LOCKS.

Hill's Patent Gearing for Fanlights, Skylights, &c., made to suit lights hung every way, and worked with cord or rod.



Prices and Particulars on application.

All kinds of Rim and Mortice Locks, Door Furniture, Sash and Casement Fittings, Swing-door Hinges, &c kept in Stock.

Reversible Four Ways.

JAMES HILL, 100A QUEEN VICTORIA STREET, LONDON, E.C.

A limited quantity of steam and water-power will be supplied gratuitously. Further supplies will be provided at a fixed rate. Counter-shafts, pulleys, belts, &c., must be provided by the exhibitor. Application for motive-power must be made on special forms which will be supplied on demand.

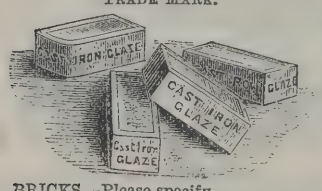
The general reception of articles at the exhibition buildings will commence on November 1, 1892, and no articles will be admitted after April 10, 1893. Foundations for heavy machinery may be put in and special constructive work commenced as soon as the state of the ground and the buildings permits.

Special regulations will be hereafter issued for the organisation of the international juries.

The Royal Commission are informed that the contract labour laws of the United States will not prevent exhibitors from importing foreign labour or from entering into binding contracts with their employés. Further information on this head will be supplied on application.

Every person who becomes an exhibitor in the British Section thereby agrees to be governed by the rules and regulations laid down by the Exhibition Executive, or by the Royal Commission through its executive officer.

SANITARY APPLIANCES.



THE public are indebted to Mr. John Jones, of Sydney Street, Chelsea, for many valuable sanitary appliances. Mr. Jones is a native of Machynlleth, North Wales, and from early years appears to have had a natural turn for sanitary engineering, which has been still more developed by study and also long experience in the practice of sanitary engineering. Being gifted with the powers of invention and the ability to work out his ideas into practical shape in the readiest and most direct way, these qualifications alone would have caused him to be ranked as an authority in this branch of scientific work. But in addition, his varied experience in matters concerning house drainage and ventilation has been largely called in request by distinguished clients in London and the country generally. The value has been recognised of the new sanitary appliances devised by Mr. Jones, besides the improvements he has introduced in what may be called existing appliances. The manhole cover is one example in which natural laws are utilised to obtain perfect results without resorting to complicated devices. The frame is made with upper and lower channels or grooves. The lower or inside cover is arched. The moisture from the drains condenses on the inside of this cover, and trickles down the sides into the channels which carry the cover, and thus produces a water seal by automatic action, and consequently no filling of any kind is required in the channels. A second seal is provided by the grooves that receive the upper lid, which may be filled with any suitable material.

A simple and effective contrivance is the patent drain-pipe stopper designed by Mr. Jones for applying the water test to drains, or arresting the flow when they are under repair. A bag of indiarubber, or like material, has attached to it a flexible tube, with a tap at the end that is connected with a small hand pump. The bag is placed in the drain-pipe, and then quickly inflated by use of the hand pump till the pipe is closed against the escape of water, air, or gas. The bag is easily removed by turning the tap, which allows the confined air to escape.

Mr. Jones has an unfailing cure for smoky chimneys in his specially-constructed patent chimney-pot; at least his experience is that he has not yet failed to cure a smoky chimney where he has fixed his patent. It is made with two exhaust chambers that have no outlet whatever from the outside, except the indispensable top outlet. In practice the wind, if it enters here, is spent before it can interfere with the rising smoke. The rotary exhaust ventilator and the fixed cowl or ventilator both contain features that are original in addition to those common to other kinds of ventilators. The advantages claimed are "a cowl or ventilator with external wings for revolving it, with internal wings or vanes for propelling the air or gases through it—the one action assisting the other—and an entire cylinder between the two, whereby the current of air operating upon the external wings is prevented from interfering with the current of air or gases passing through the interior, and the circular or bulb portion at the lower point providing an exhaust chamber should wind enter from the top and so prevent its proceeding further into the chimney." It can be further arranged to prevent the entry of snow or hail, and also it can be used for the introduction of fresh air into a building as well as for exhausting vitiated air. In the case of the cowls and ventilators natural laws are relied on to produce efficiency.

The ventilation of sewers in connection with house-drains is effectively secured by combining the use of the patent manhole-cover with other inventions carried out on the same principle, of attaining the best results with the least amount of complexity possible.

THE "ECLIPSE" PAINT REMOVER & CLEANSER.

The Best, Cheapest, and Most Effective in the World. 1A CRESCENT, MINORIES, LONDON, E.C.

ART METAL WORK.

This lectern was designed by the late Mr. E. J. Tarver, architect, for Messrs. Richardson, Ellson & Co., art metal-workers, by whom the work has been executed in their best style. The idea embodied is that of "The Church founded upon a Rock." The base of the lectern is massive and bold. It is of polished brass, with pierced panels of polished copper, and is supported by four large claw-feet. Above this the stem assumes the form of a curved octagon, each face of which is nicely engraved. It is of polished brass, and is immediately surmounted by a shaft of polished copper, also handsomely engraved. Around are four ornamental brass pillars, which run up to and form a support for the brass rockwork, upon which is planted the Church surmounted by a dome. Immediately above, and revolving, are the book boards of polished brass beautifully engraved with sentences from the Gospels. The whole design is unique and the workmanship of the highest order, and to anyone desirous of possessing a worthy memento of the late talented designer, or of making a suitable present to a deserving church, a favourable opportunity is afforded of obtaining a really handsome lectern, and one out of the common order. The lectern, which is suitable for a cathedral or large church, may be seen at any time (and inspection is invited) at the show-rooms of Messrs. Richardson, Ellson & Co., 17 and 18 Brownlow Street, Holborn, W.C. The price is 130*l.*

THE WATKIN TOWER.

The directors of the Tower Company, Limited, of which Sir Edward Watkin, M.P., is chairman, and whose capital of 70,000*l.* was privately subscribed by certain shareholders in the Metropolitan Railway Company, have entered into an agreement to lease about 124 acres of the Wembley Park estate, together with the now almost completed foundations of the proposed tower. The agreement for the lease, which was signed last week, is for a term of 999 years at a rental of 2,000*l.* a year from October 21, 1892, in addition to one-fourth of the annual profits after the lessees have received a dividend of 15 per cent. per annum. This lease has been taken by a newly-formed company, of which Sir Edward Watkin, M.P., is also chairman, and whose proposed capital of 200,000*l.* will be wholly devoted to the erection of the structure of the Tower, above the levels of the foundations.

REGISTRATION OF PLUMBERS.

A PUBLIC meeting has been held in the Town Hall, Belfast, under the auspices of the Ulster District Council for the National Registration of Plumbers, for the purpose of hearing an address by the Clerk of the Plumbers' Company, London, on the draft of a Bill to give legal effect to the system of registering plumbers. In the unavoidable absence of the Mayor the chair was occupied by Mr. Wm. M'Cammond, J.P., and there was a very large attendance of representatives of the trade and the public, including Dr. Whitaker, consulting sanitary officer of health, Professor Fitzgerald, Mr. J. J. Philips, architect, Mr. P. C. Cowan, C.E., Mr. W. J. Gilliland, C.E., chairman of the Registration Committee, Mr. Richard Patterson, J.P., &c.

The Clerk of the Plumbers' Company gave a short account of the steps which had led up to the Bill which he was about to explain to the meeting, and he stated that one fact alone would convince them of the necessity for such a Bill, and that was that it had been estimated upon very competent medical authority that fully one-third of the preventable disease and deaths in the United Kingdom was directly due to defective drainage. Another point he wished to direct attention to was that, although the most recent legislative enactment dealing with sanitation, the Public Health (London) Act, passed in the last session of Parliament, embodied a great number of provisions relating to plumbers' work, not a single clause in that Act, or any other of the existing Acts, relate to the qualification of the men who had to carry out that work, the plumbers. Coming to the Bill itself, the speaker wished to point out that it was what was called an Enabling Act. It was not a compulsory or coercive measure. It proposed to create a general Council of competent jurisdiction and authority, to be made up of members of the various provincial organisations that were now concerned in carrying forward the movement, with the addition of representatives from some of the architectural and educational bodies and some medical bodies, whose aims were such that their representation upon the Council would be likely to further their common interests. Then the Bill contained provisions for regulating the qualification of those entitled to use the title Registered Plumber. It also provided for a competent Board of Examiners, and the keeping of a legal register. The Bill further provided for due inquiry into complaints against registered men, and, in cases of default, for striking names off the register. The Bill made it a penal offence for anyone to personate a Registered Plumber. After full discussion the following resolutions were passed :—

"That this meeting is of opinion that an efficient system of registration of plumbers is essential to the protection of the health of the community, and such a system having been established by the Worshipful Company of Plumbers, London, we believe the time has arrived when application should be made to Parliament for powers enabling a national Council of competent jurisdiction and authority to take measures for promoting the technical education of plumbers and regulating the practice of those registered."

"That this meeting, having considered the Bill promoted by the Worshipful Company of Plumbers, hereby express their general approval of the principles of the same, and resolve to give it their hearty support."

LONDON WATER SUPPLY.

THE County Purposes Committee of the Corporation of the City of London have prepared a report of their proceedings under the references in relation to the water supply. The committee regret that their Bill was rejected, as it provided *inter alia* for immediately and efficiently carrying out every necessary inquiry, instead of remitting the question to an uncertain future. It is, however, a matter of satisfaction to them to notice that the proposed joint action of the Corporation and the County Council met with as much favour at the hands of the Select Committee as it had with the bodies themselves and the very large public they represent. If the supply of water to the metropolis is to be transferred from private enterprise to municipal control, what course is to be adopted? In all the larger towns the course adopted had been the purchase of the existing supply, and when that had proved inadequate, the addition of a supplemental supply. The committee therefore recommend that the necessary steps be taken to introduce a Bill next session to give statutory powers to the joint committee of the Corporation and the London County Council; to authorise that committee to give notices to treat to the metropolitan water companies within four years and to make the giving of such notices obligatory at the expiry of that period; to constitute a tribunal to ascertain the price to be paid, and to clothe such tribunal with the fullest powers of inquiring into and deciding upon all such questions as it might consider necessary with a view to purchase; to enable the tribunal to

FROM THE LONDON AND SUBURBAN SANITARY SURVEY ASSOCIATION.

"Connaught Mansions, Victoria Street, Westminster, S.W.: April 24, 1890.

"I have now had one of your 'Grahtryx' Smoke-Test Machines in use some time, and find it exceedingly useful and reliable. I inspect several hundred houses annually, and in many of them I find something more than the ordinary smoke tube absolutely necessary, and your machine meets that want. It is, I consider, the most portable, compact, well-fitted, and perfect little machine in the market, and invaluable to all Sanitary Authorities, Engineers, Inspectors, and Plumbers. It should also be of great value to Nurserymen, Plant-growers, Florists, &c., as an exterminator of green fly and other pests. I have tested it in this way in my own vinery, conservatories, &c., and find it most efficient when used with tobacco paper. It should also be of great service to gamekeepers for the rabbit warrens, and for bolting rats. "EDWARD TIDMAN, C.E., M.S.A., and M.P.S.I., and A.S.M."

FROM THE GLASGOW SANITARY PROTECTION ASSOCIATION.

"In reply to your inquiry, I have to state that I have had the Smoke Machine in daily use for over six months (on about 200 different occasions), and have found it very satisfactory, both as regards efficiency and handiness. "GILBERT THOMSON, M.A., C.E."

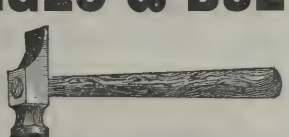
decide as to the purchase by local authorities outside London of the works of distribution within their district; and also to decide as to the supply of water in bulk to such outside authorities, and to pay for the undertakings by stock having the ultimate security of the county rate.

THE PRESERVATION OF IRON AND STEEL STRUCTURAL WORK.*



ONE of the most important economic questions of the present day is the preservation of iron and steel structures. In America many millions of dollars are annually spent in the erection and construction of these, and the amount is increasing in rapid proportion. Bridges, buildings, viaducts, ships and machinery are now being made of these materials to almost the entire exclusion of others. From their very nature iron and steel are peculiarly subject to decay from atmospheric and other influences. The question of preserving them is not merely one of dollars and cents, but, especially in the case of railroads, one affecting the lives and property of a large portion of the community. What, then, is the best method of preserving them?

The almost universal method is by means of paints, or the application of substances to their surface which will resist or retard the influence of air, water and other destructive agencies. The requisites of a good paint for this purpose are that it shall adhere firmly to the surface and not chip or peel off, thereby leaving portions of the surface exposed. It must not corrode the iron, else the remedy may only aggravate the disease. It must form a surface hard enough to resist influences which would remove it by friction, yet elastic enough to conform to the expansion and contraction of the metal by heat and cold. It must be impervious to and unaffected, as far as possible, by moisture, atmospheric and other influences to which the structure may be exposed.

The paints that have been used for this purpose are principally asphalte and coal-tar paints, consisting of mineral and artificial asphalte or coal-tar either applied alone or combined with each other, and, more or less, with metallic bases, and iron oxide paints and lead oxide paints, especially red lead, in all of which the pigment is held to the surface of the iron or steel by combination with linseed oil. The choice of paints must lie, so far as our present practical experience goes, between these three classes, zinc oxide being found to be entirely unsuitable on account of a propensity to peel off. What, then, is found to be the experience in actual practice with these? Asphalte and coal-tar paints run when exposed to the sun and other sources of heat, which is a serious matter with vertical surfaces, and after a time become extremely brittle and scale off entirely, leaving the under surface exposed unless the paint is constantly renewed. In the meantime the exposed iron and steel are being corroded by rust. Iron oxide paints, including "metallic brown," are paints made from iron ore, or by some chemical process with an iron base. These are invariably iron in a greater or less degree of oxidation, or, in other words, rusted iron. Now it is well known that one of the most active promoters of rust or decay in iron is the rust itself. Under the combined influences of the moisture and carbonic acid of the atmosphere iron oxide or iron rust becomes a carrier of oxygen from the air to the metal, rust begetting rust. It is therefore evident that this material alone has no preserving effect on iron; in fact it promotes its decay.

How is it when combined with linseed oil in the form of paint? In the economy of nature iron oxide is a great disinfectant. When in contact with organic matter and moisture, even at a low temperature, under favourable conditions it readily gives up oxygen, destroying more or less the organic matter, and being itself reduced to a lower oxide. When thus reduced, with equal readiness it absorbs oxygen from the atmosphere, and again passes it on, thereby promoting and eventually insuring the destruction or transformation of the organic matter with which it may be in contact either in the soil or elsewhere. The same process appears to take place when combined with linseed oil in the form of paint and exposed to atmospheric influences, the oil being the organic matter. If linseed oil in drying formed an air and waterproof film it might be urged that the oxide of iron would be entirely protected from the direct influences of oxygen of the air and moisture. Such, however, is not the case. The most eminent authorities have recently shown that the dried film of linseed oil, unless united with a pigment that combines chemically and forms a waterproof coating with it, actually absorbs water very much like a sponge. Where water will go, air will also go, and we thus have in direct contact with the iron oxide of the paint, which does not combine chemically with oil, those elements air, moisture and organic matter, which cause the iron to become a

carrier of oxygen and a destroyer of what it is in contact with. It is well known that iron paint darkens with age; this is caused largely by the iron oxide losing oxygen, which is partly transferred to the oil, burning it up and destroying its tenacity, as may be seen by examining iron structures painted for some time with iron paint or metallic brown, the paint being found extremely brittle and in feathery scales. This is not all the damage that is done. The iron oxide in the paint becomes a carrier of oxygen to the very metal it was designed to protect, and the process of corrosion is commenced and carried on under the paint, which eventually peels or scales off, the surface of the metal being found more or less oxidised and corroded.

Asphalte and iron oxide being thus shown to be entirely incapable of preserving the iron, it remains for us to consider the effect of red lead. This pigment has the property of forming with linseed oil a hard elastic coating, clinging with great tenacity to the metal. It has no oxidising effect on iron and does not act as a carrier of oxygen from the atmosphere after the paint has set, neither does it render the oil brittle nor promote rust. When red lead fails it is principally by gradual wear or friction from the outside. It does not scale or blister, which both asphalte and iron oxide paints will do, thereby requiring a thorough scraping and removal of old material before a new coat can be applied. Any red lead pigment adhering to the metal forms a permanent base for subsequent paintings and is utilised in further preserving the metal. The Government specifications for ironwork in the new Library Building of Congress provide that "all the work not Bower-Barffed must be given one coat of pure red lead paint—not metallic paint of any kind, but pure red lead—before leaving the shop and before becoming rusted."

The experiments of the Navy Department on the preservation and fouling of plates covered with different pigments may be interesting. A plate of iron covered with asphalte paint was immersed in sea-water for eight months and six days at the United States Navy Yard, Portsmouth, N.H. At the end of that period it was found to be covered with scum and mud, and very badly rusted. A plate coated with iron paint immersed at Key West, Fla., was found to be covered with branch shell and coral, but little paint remaining, and very badly pitted and rusted. A plate with two coats of red lead, at the Norfolk Navy Yard, was found to have a few barnacles attached, but to be in fair condition, with no rust whatever on the iron after the paint was removed. It will be seen that not only did the red lead protect the iron better than the other pigments referred to, but that the plates were in far better condition as regards barnacles and fouling. The superiority of red lead being thus established, it is adopted for use on hulls of Government warships.

On the Dutch State railroads a series of experiments extending over a period of three years were made with the above pigments on scrubbed plates, as well as those which had been pickled in acid to remove the scale. It was found that the red lead was superior in each case to the others.

If red lead is thus proved to be the best pigment for preserving iron and steel structures, what is the proper method for applying it? We have seen above that the value of red lead depends upon its forming certain combinations with the oil and actually setting very much the same as plaster of Paris or cement sets when mixed with water. To successfully work with the latter substance, it is necessary to put them in shape as quickly as possible after mixing with water before the setting takes place. If the chemical action of setting has partly taken the place the material may be moulded, but it is well known that good results will not be obtained. Red lead, like these substances, must be applied to the work before it sets with the oil. It is on this point that failures in the use of the pigment have generally occurred, because if it be applied after the combining or setting process has taken place, the hard, elastic, clinging coating will not be formed on the iron surface.

The following is the practice of one of our largest shipbuilding establishments in applying red lead to the hulls of Government vessels. The plates are first pickled in a dilute solution of muriatic acid, then passed through rapidly-revolving wire brushes, which remove all scale and dirt, leaving the iron with a bright, smooth surface, then thoroughly washed with pure water and rubbed entirely dry and immediately coated with red lead and pure raw linseed oil. The red lead is first thoroughly mixed with just enough linseed oil to form a very thick, tough paste, which will keep for several days without hardening. This paste as wanted for use is thinned down to the proper consistency for spreading with pure linseed oil, and applied at once, care being taken to leave paint-pots empty at night. A gallon of paint thus prepared contains about 5 lbs. of oil and 18 lbs. of red lead, and will cover on first coat about 500 square feet. In this way the red lead and oil get their initial set on the surface of the iron, and the closer the pigment is brought to the iron the more durable will it be found. Some parties prime iron with iron oxide paint or metallic brown before applying red lead, which I believe to be a mistake, as this paint

readily scales from iron and, of course, carries the lead with it. Others coat the iron with oil before applying the red lead; this, too, prevents the adhering paint from coming in contact directly with the surface, and should be avoided, provided the iron is properly prepared by thorough cleaning and removal of any scale and moisture, which is a matter of the greatest importance. In priming wood surfaces which are absorbent of oil, the best practice favours the putting on of a coat of pure oil, or oil thinned with turpentine, which shall penetrate the surface and form a binder for the subsequent coats. With iron the case is quite different, provided we have a paint which, from its very nature, can attach itself firmly to the surface, because it is out of the question for it to hold on to the surface of iron by any process of absorption into the pores of the metal, as linseed oil will not penetrate to any extent. Such a paint should be put directly on the surface of the clean, dry metal—as is done in the cases of Government vessels referred to—without the intervention of a coat of oil or other substances.

The rusting of iron before the application of paint, which is sometimes recommended, should by all means be avoided, as it not only prevents the contact of the paint with the metal, but induces a chemical action which may go on with its corroding work under the applied paint.

As to the relative cost of iron oxide paints and red lead, there is no doubt that the first cost of painting structures with iron oxide is somewhat less than with red lead. The best railroad authorities state, however, that labour in painting structural work costs twice as much as material. The true economy must therefore be sought in the durability of the paint as well as the preservation of the structure from rust. Actual experiments have shown that structures painted with iron paint had to be repainted the third or fourth year, those with red lead not until the sixth year. In the second painting with iron paint the old material must be entirely removed before a fresh coat can be properly applied, entailing considerable increased cost, whereas with the red lead no such expense is necessary, but, as before stated, a portion of the pigment remains on the iron, continuing to protect the surface, and is the very best base for the new coat, besides contributing materially toward it, lessening the expense of each repainting. It will therefore be easily seen that, although in first cost red lead may be slightly dearer than the iron paint, yet in the long run it will be greatly cheaper, besides giving assurance, for the reasons above stated, that the structure is not deteriorating from the effects of the atmosphere and paint.

Before closing this article it might be well to allude to the effect of lampblack when mixed in small quantities, say an ounce to the pound of red lead. It changes the colour to a deep chocolate, a possible advantage in some cases, and also prevents the red lead from taking its initial set with linseed oil as quickly as when mixed with oil alone. Experiments recently made showed that this compound would remain mixed in paste form with linseed oil some thirty days without hardening. Thorough mixture is of the greatest importance, and should be done in the dry state before adding the oil. If rapid drying is desired, Japan dryer can be mixed with the oil used in thinning the paste before application with the brush.

Too much stress cannot be laid on the great importance of having the metallic surface perfectly clean and as free as possible from scale and rust before the application of the paint. Where pickling with acid is impracticable, as is frequently the case in railroad and other structural work, thorough brushing with wire brushes should be resorted to.

THE RIVIERA.

THE winter stations of the Mediterranean littoral, says a correspondent of the *Times*, are being cleared of the accumulations of summer-dust, and their bright habitations reopened for the reception of the stranger, who constitutes so profitable a source of revenue. There are all the evidences of a very busy season in store for the Riviera—the prospect, indeed, has not been so bright since the time of the earthquake. An extraordinary amount of activity is being displayed in the matter of new buildings and improvements all along the coast. Even at this early period villas and apartments are in great demand—much greater than has been the case for many seasons past. The consequence, in Nice at any rate, is a general rise in rents of from 25 to 50 per cent. Naturally this extra expenditure on the part of the tenants will recur later upon the foreign visitors. Last year the prices asked for villas and suites of rooms were quite high enough, and it is necessary to give a warning note that further advances may result in retaliation on the part of the stranger. Already he pays dearly for his sunshine and blue sky, if these are the things he seeks, or for his festive gaiety, if he journeys southward for that alone. Nice brought disaster upon herself seven or eight years ago by wanton speculation and extravagant charges to her

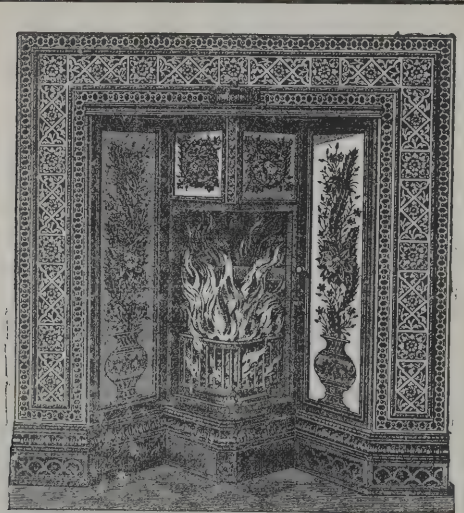
guests. It is but a friendly act to point to the danger which is again appearing ahead.

Regret must be expressed that the Nice municipality has not yet completed its drainage system by carrying the sewage far out to sea instead of allowing it to run into the Mediterranean just under one's nose as one walks the otherwise charming Promenade des Anglais. The action of the authorities in this matter is quite typical of the easy-going southern methods of making sanitary improvements. Last summer the necessary pipes for conveying the sewage into deep water were brought down to the beach, and just as the season opened a few of them were laid down. Then the visitors began to arrive, and, as it was considered to be of much more importance not to have the promenade upset during the season than to complete the work, its continuation was postponed until this summer. But a storm came and washed up the pipes, and broke others left lying about. Now they have all been carted away again, and the obnoxious streams flow on as before to meet the blue waters of the tideless sea just where they lap on the shingle at the beach. The system of drainage in Nice is in itself fairly good for a southern town; there is a splendid supply of water for flushing the sewers, if only a more liberal use were made of it. The British Consul in Nice has drawn attention to this matter time after time, and he has given the municipality full credit for all that it has done. After this, however, a strong protest must be made on behalf of those who come here for their health's sake against this further postponement of a most necessary piece of sanitary work. As I shall presently show, Nice is now far behind all her neighbours upon the French Riviera in this matter of the proper disposal of the sewage of the town.



Cannes, on the other hand, has been exceedingly busy during the past summer in carrying out sanitary and other improvements. After consultation with eminent engineers, English amongst them, an efficient drainage scheme is approaching completion. Pipes, after the Hulton principle, are now laid throughout the town at such a depth as to enable the inhabitants to connect their dwellings easily. The collecting sewer is carried far out into deep water behind the port, and in a year or two it is to be taken to a point on the coast some miles away. The drains are supplied with automatic *chasses d'eau*, and, as there is an abundant supply of water from the Siagne Canal, they can be flushed several times a day. This work has been accomplished by the municipal engineer, M. Ferrand. He has further carried out considerable improvements in the driving roads round Cannes, especially in the east and west quarters of the villa proprietors. Electric lighting has also been introduced, and the residents are taking up the scheme readily.

The Boulevard de la Croisette in Cannes has hitherto presented a most dilapidated front, all attempts to keep an embankment intact against the action of the waves having failed. Another plan, one of conciliation with *la belle mer*, is to be tried. In place of the rigid sea-wall, groynes of masonry are being run out at right angles with the promenade, and sloping gently towards the water. The sand will be gradually silted up against them until the boulevard will have a long sloping beach, far more attractive to the eye than the existing walk, and one capable of combating all the ill-humours of the Mediterranean.

Other projects in Cannes for which the necessary money votes have been secured are the improvement of the port and the building of a new post and telegraph office. For years English yachtsmen have been agitating the former proposal through their Vice-Consul, and the great influence of the Prince of Wales was enlisted in order to obtain from the French Government the necessary grants to make a safe anchorage for small craft in the harbour of Cannes. The existing breakwater is altogether inadequate to stop the force of the waves when the usually peaceful Mediterranean is stirred up by the Mistral or when the occasional storms of spring-time are raging. It is therefore proposed to extend the sea-wall by 200 mètres. Then it will constitute an effectual shield for the frailer yachts frequenting the Riviera ports which are now obliged to seek shelter at Nice or Antibes. The existing post and telegraph office, dark, inconvenient and always dirty, is a disgrace to a town of the pretensions of Cannes. The necessary site has been, however, acquired for the new building, the streets in the vicinity are being opened up, and the work will be proceeded with as soon as other improvements already referred to are out of hand. Altogether, M. Gazagnaire, one of the most enterprising mayors Cannes ever possessed, and his colleagues upon the municipal council have the gratitude of the numerous colony of English for their efforts to make winter residence there healthy and agreeable. The property owned there by strangers, chiefly English, is worth over 3,000,000*l.*, and the improvements made in the sanitary conditions of the place will, of course, considerably enhance its value.

The new "Casino des Fleurs," built in the fashionable Montfleury quarter of Cannes, is just now the subject of much discussion. A fine building, with theatre, ballroom, reading-room, club and other salons for *les jeux* (if the concession is granted), it occupies more ground than the famous establish-

ment at Monte Carlo; and an endeavour is being made to imitate the surroundings of the latter by the formation of gardens of rare trees and plants. But the questions arise, Does Cannes need such a place? and Will it not tend to lower the high social tone which has hitherto been a distinguishing feature of this aristocratic resort? To speak for the English villa residents and for the higher classes of the French, the balance of opinion seems to be against the establishment.

Beaulieu is making rapid advances into favour amongst the English. The choice of this charming spot by Lord Salisbury for a winter residence has naturally given it a great lift forward. The Premier obtained the finest site, with 60,000 mètres of land surrounding it; just below his lordship's property stands the villa of another Englishman, and a number of others, including Mr. Baird, who is really the founder of Beauleau as a winter resort, are scattered about amongst the olive and lemon groves and the beautiful gardens of southern plants and flowers. It is not likely that Lord Salisbury will return to Beaulieu this winter, since, before leaving the other day, he gave instructions to agents in Nice and Mentone to let his villa, if possible, for six months. As soon as this fact becomes generally known, there is no doubt that the somewhat high price fixed upon as rental by Lord Salisbury will be easily realised. The Americans, at any rate, can scarcely afford to let slip so splendid an opportunity for indulging one of their little weaknesses. The Maharajah Dhuleep Singh has rented the Villa Sicard, at Beaulieu, for his family. Sir Edward Malet has just bought land upon one of the small "caps" between La Turbie and Monaco, for the purpose of building a residence there. In giving instructions as to its character in drawing up the plans, Sir Edward remarked that he had no intention of retiring yet awhile from the diplomatic service, but the villa must be ready for his occupation in three years, in view, doubtless, of that event.

The fair face of Monaco, "the beauty spot of the Riviera," is changing continually. At the present rate at which building operations are being carried on, every yard of ground in the Principality will soon be occupied. Rumours have been running round the English Press that the gambling concession was approaching its end, but if any evidence was needed to prove that the "Société anonyme des Bains de Mer et du Cercle des Etrangers" had still a long lease of life, we find it in the extensive additions now being made to its hotel and in the redecoration of the gambling rooms in progress. It is not likely that a company, which during the past few years has conducted its affairs in the most parsimonious way, would spend money in this fashion if its privileges were to be withdrawn, as reported, in April next year. Let me say once more that the exact date of the expiration of the concession granted by the late Prince Charles of Monaco is 1913 and gambling must go on until that date, unless some unexpected event comes to stop it. Further remarks upon this subject I must defer until the half-yearly meeting of shareholders, which takes place at the end of the month.

Cap Martin, a picturesque headland stretching a couple of miles seawards between Monte Carlo and Mentone, is another happy discovery on the part of the enterprising British. Two years ago this point was bought up "in the rough" by Mr. Colville White, who built villas, which were readily purchased, and last year a company was formed and an hotel constructed on the head of the promontory. So great was its success that the building is now being doubled in size. The surroundings are of that *sauvage* tranquil character which many English people seek for and nowadays often fail to find near the more popular Riviera resorts. The views, north, south, east and west, are charming. The Empress Eugénie was so delighted with her stay at the Cap Martin last season that she has just bought 17,000 square mètres of land on the west side, which looks towards fair France, and Her Majesty has instructed Messrs. Giles & Gough, of London, to prepare plans for a villa which she intends to have constructed there.

Mentone for a long time held the reputation of being a sleepy town. During the past year or two, however, she has cast aside this slur upon her character, and she is now moving forward as fast as any of her competitors on the coast. The drainage scheme is completed, and this week it met with the approval of the French Sanitary Inspector-General, Dr. Proust. Ten days ago one hundred and twenty members of the French Society for the Advancement of Science visited Mentone, and they also expressed themselves satisfied with the sanitary condition of the place. A *maison disinfection* has been established for the fumigation of the contents of houses in which infectious diseases have occurred, and this has been made compulsory. The new breakwater is also completed, and whilst the summit of the wall constitutes a very fine promenade, the harbour is now a much safer anchoring-ground for yachts. This summer the prayer of English yachtsmen to have the harbour lighted by gas has also been answered. A new station—the Gare de Garavan—is to be opened on November 3. It will prove a great convenience to residents in the now fashionable eastern quarter of the town.

EXTRACT FROM LETTER OF AN EMINENT ARCHITECT.

"Having used every Ventilator of any prominence, I recently tried yours, and am satisfied it is the best in the market. An important feature is that your appliances are an effective addition to a building instead of an unsightly drawback as hitherto."

CLIMAX VENTILATING CO., 15 Great George Street, Westminster, S.W.

Printed by SPOTTISWOODE & CO., at No. 5 New Street Square, E.C., and published for the Proprietors by P. A. GILBERT WOOD, at the Office, No. 175 Strand, W.C. London.

H. KING & CO. (*accepted*).

IMPROVED

FLAT BRICK FIRE-PROOF FLOORS.

Transverse Section.

Longitudinal Section.

NO THRUST ON WALLS.

The BEST as well as the CHEAPEST Fire-proof Floors yet introduced.

THEY are constructed with purpose-made hard-burnt bricks, with moulded projections protecting the iron, and provided with wedge joints throughout, forming the most compact and solid floor known

The soffits of the bricks are specially prepared to key up the ceiling plaster. No laths or counter ceiling are necessary. They are not affected by water, acids, or alkalies, and they may be fixed during the progress of building, thus dispensing with the use of internal scaffolding.

The floors are practically noiseless, the different densities of the concrete, brick and plaster, with the air space above, intercepting the sound vibrations.

The depth of the finished floor is 6 to 9 inches only, and when the saving on this head is taken into account, the cost of a building with floors of this construction does not exceed that of one with the ordinary combustible timber floors of corresponding strength.

BRITANNIA TIN AND COPPER WORKS.

TO ARCHITECTS AND BUILDERS.

Fountain Street, Bury, and Shiffnall Street, Bolton:
February 13, 1891.

Gentlemen,—We have pleasure in announcing that we have opened extensive Show Rooms at 117 QUEEN VICTORIA STREET, LONDON (opposite Civil Service Stores).

We have been very successful in Lighting and Ventilating Public Buildings in all parts of the Country.

We have a large stock of Sunlights, Turrets, Exhaust Roof Outlets, Tobin's Tubes, Air Grids, &c., &c. at our Show Rooms.

We feel confident that our **DESIGNS**, as well as our system of Lighting and Ventilating will commend themselves to all who are interested in having BRILLIANTLY LIGHTED and WELL-VENTILATED ROOMS.

A visit to our Show Rooms will be esteemed a favour. If inconvenient to call, send for one of our Illustrated Catalogues, inspect our Designs, and read our Testimonials.

Trusting to receive your favours, which shall have our prompt attention,

THE FAULD GYPSUM MINES.

THE members of the North Staffordshire Naturalists' Field Club during the last excursion of the season visited the Fauld gypsum mines. The workings are all on the level and are of great extent, piercing the hill in all directions wherever the beds of gypsum are found to lie. After a walk of about a quarter of a mile underground, the party halted in front of the finest deposit of the mineral where the huge blocks are quarried for church use, &c. The mineral *in situ* is charged with a large percentage of water, giving it a grey appearance, with marl-coloured veins and streaks running in every direction. On holding a light behind a lump of the mineral its beautiful transparency became evident. Mr. Burke read a paper on the gypsum deposit. He said the gypsum beds at Fauld occur in veins and lenticular masses or pockets, varying from an inch to over 35 feet in thickness. The bulk of the rock is stained red and yellow by the infiltration of iron oxide, but beautiful masses of pure white alabaster are met with. This deposit of gypsum is intercalated between beds of the best-known red marls of the Keuper, the upper division of the Trias formation, which extends over so large a portion of the Midlands. Chemically, it consists of calcium sulphate, with the addition of two parts of water of crystallisation. It is the product of a great salt lake or inland sea, such as the Caspian Sea of the present day, fed by rivers; the incoming water only partially met the loss by evaporation. Under these conditions, when 37 per cent. of water has been evaporated, gypsum begins to be deposited. A further concentration and evaporation of the water leads to the deposition of chloride of sodium (rock salt), but as this latter mineral is not found here, it must be assumed that either the water was diluted before the point of saturation for rock salt was reached, or the salt, if deposited, has been subsequently dissolved, or removed by denudation. The lessees, Messrs. Newton & Staton, had kindly illuminated the passages of the mine, and the various interesting spots were shown by means of magnesium lights. The next point of interest was the getting of the mineral for making cement, plaster of Paris, &c., and the party were conducted to the face of the working where the workmen were at actual work, and the mode of drilling and blasting, &c., was fully explained. The party then returned through other portions of the workings, halting here and there to admire the curious and beautiful growth of fungi on the timbering of the mines, and then emerged on the opposite side of the hill to that in which they had entered. The plaster and cement works of Messrs. Staton, at Tutbury, where the Fauld gypsum is converted into plaster of Paris and cement, were also visited, and the process of manufacture was explained by Mr. H. Newton.

TRADE SYNDICATES IN FRANCE.

THE Ministry of Commerce has just published some statistics giving the number of trade syndicates in France, and showing the increase which has taken place since the year 1884, when a measure was passed recognising their right to exist, whereas they had up till that time only been tolerated. The number of syndicates now in existence is 3,253, of which 2,503 are industrial and commercial associations, while 750 are agricultural; while of the industrial and commercial associations, 1,127 are for employers, 1,250 for workmen, and 126 mixed syndicates—that is to say, embodying both employers and employed. There are also 127 irregular syndicates—that is to say, associations which have not yet complied with the formalities required by the law of 1884, so that the total is 3,380, these being spread over 962 communes or parishes, although the great majority of them are, of course, in the large towns. They have, in all, 596,380 members, of whom 106,157 are employers, 205,152 working men in towns, and 269,298 peasants and agricultural labourers, thus showing the large increase of 114,947 members within the last twelvemonth. The figures giving the number of members show, however, that only 5 per cent. of the employers, 6 per cent. of the working men in the towns, and 8 per cent. of the peasants and agricultural labourers belong to syndicates, the trades which show the largest proportions being those of the builder, the miner, the baker, the wholesale liquor-seller, the cotton-spinner, the boot and shoe maker, the hatter, the butcher and the upholsterer.

BUILDING AND BUILDERS.

IT is proposed to build a new church for St. Faith's District, Lincoln, at a cost of something over 3,000*l.* Rev. E. Wharton and Mrs. Wharton give 1,000*l.*, and Mr. John Foster 500*l.* towards the cost.

A CHEQUE for 2,000*l.* has been sent to Mr. W. Quarrier for the purpose of building another orphan home at Bridge of Weir.

THE London correspondent of the *Manchester Courier* says :—I hear for the first time, upon unquestionable authority, that the late Mr. John Cochrane, who committed suicide at his offices in Westminster a few weeks ago, was driven to the act immediately after receipt of a lawyer's letter from the Liverpool Corporation concerning the contract which he had undertaken for constructing the Vyrnwy tunnel under the Mersey. The Corporation had imposed in this matter conditions of work against which Mr. Cochrane had protested on the ground that they were impracticable and all but impossible, and, as was admitted at the meeting of the Liverpool Town Council the other day, he had lost about 17,000*l.* over the contract. Just before Mr. Cochrane received the lawyer's letter abovementioned the Corporation consulted Sir Benjamin Baker with regard to the tunnelling, and in consequence of opinions expressed by that eminent engineer decided to modify the conditions which they had imposed upon Mr. Cochrane. Unfortunately the decision was not promptly communicated to Mr. Cochrane, otherwise I am assured he would have been still alive. Sir Benjamin Baker was greatly distressed to hear of Mr. Cochrane's death, and the more so because he could, had he seen him a little while before, have given him news which must have prevented it.

OPERATIONS have been begun for the provision of a new Board school at Tong Park, for the Baildon School Board. The building will cost 2,750*l.*, and will accommodate 130 mixed and 70 infant scholars.

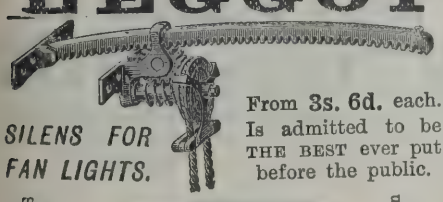
THE annual statement of the Dean of Guild Court, Greenock, shows that there had been thirty-one courts held during the year, and that 712 cases had been considered, as compared with 745 in 1890 and 733 in 1889. The applications for building warrants comprised three tenements of shops and dwelling-houses, one villa, three public buildings (churches, &c.), twenty-five buildings for business purposes, sixty-five miscellaneous buildings and sanitary improvements and sixty additions and alterations to property. The total estimated cost of the buildings and alterations authorised was 35,449*l.*, as against 36,060*l.* in 1890 and 35,070*l.* in 1889. Building warrants were granted in connection with three new industries—the Preserve Works, the Cabinetmaking Works and the Cereal Company.

THE following resolution has been submitted to the Southampton Town Council :—"That the Hants Literary and Philosophical Society hears with concern that it is proposed to build a mortuary against the town wall, and trusts that the Corporation will not allow the wall to be obscured in this way."

AT the Edinburgh Dean of Guild Court warrant was granted to Messrs. Usher & Co. to take down old buildings to the north of the Edinburgh Distillery at the Siennes, and to erect buildings five storeys in height, to be used as bonded warehouses and maltbarns, with relative stores.

PLANS have been passed in the Glasgow Dean of Guild Court for the erection of a hall and reading-room for the use of the workmen at Earnock Colliery. Plans for 112 workmen's houses at the colliery were passed at the same time, the estimated money value of the whole being about 9,000*l.*

THE *Bolton Chronicle* says in regard of the fund for the erection of public baths in Farnworth, that the fund, including the 1,000*l.* so generously offered by Mrs. Almond, now amounts to close upon 2,500*l.*, and a meeting of the committee will shortly be held, at which steps will be taken for the commencement of the work of erection. Another 500*l.* is required before the amount really wanted is realised.



THE Town Hall, erected at Cleckheaton at a cost of 12,000*l.*, is to be formally opened on February 10. The building has been erected from the plans of Messrs. Mawson & Hudson, of Bradford.

THE executive committee of the society for building workmen's houses at Biesdorf, near Berlin, have been informed that the Emperor of Germany has expressed himself highly satisfied with the fittings of the model house which he recently visited.

MR. THOMAS SEXTON, whose tender had been accepted for additions to the Town Hall of Dalkey, co. Dublin, has declined to carry out the contract, as the season is so far advanced. When he made out his tender it was, he informed the Board, on the understanding that the work was to be done at the time when the days were long and fine. The Board have made an order that new tenders be advertised for.

AT Hove the employés of Mr. S. C. Smale, builder, at a dinner at the Neptune Inn, presented their employer with a

testimonial. About forty sat down to dinner, after which Mr. H. Mew made the presentation, which consisted of two massive bronze statuettes. Mr. Smale, in thanking them, said that it gave him great pleasure to know that he was held in such esteem by his men.

THE foundation-stone of a new London theatre in Cranborne Street, Piccadilly, has been laid. The building will be erected from the designs and under the superintendence of Mr. Spencer Chadwick, Mr. C. J. Phipps having acted as consulting architect.

THE Woolton Local Board have accepted the offer of Mr H. Gaskell, J.P., to build public baths for the village, if the Board find a site and maintain the baths when built.

OFFICES erected for the Swindon Local Board have been opened by the Marquis of Bath. The contract, which was for 8,000*l.*, was undertaken by Mr. J. Reed, of Plymouth, the architect being Mr. Brightwen Binyon, of Ipswich.

AT the annual meeting of the Birmingham Kyrle Society, held at the Edgbaston Assembly Rooms, it was decided to erect a new hall in place of the present building in Lawrence Street, at a cost of between 3,000*l.* and 4,000*l.*

TRADE NOTES.

ST. MARY'S Catholic Church, Burnley, is at present undergoing renovation, special attention being paid to the ventilation of the church, which has been entrusted entirely to Messrs. Baird, Thompson & Co., ventilating engineers of London and Glasgow, who are introducing their well-known Æolus invisible or concealed self-acting roof ventilators for the extraction of the vitiated air, and their Æolus improved waterspray air-inlet ventilators for the admission of a pure supply of fresh air. This system has been applied to numerous churches and public buildings with the greatest success. The whole of the ventilators are entirely concealed, and a complete and efficient system of ventilation is being carried out without draughts.

THE new Infectious Diseases Hospital, Burton-on-Trent, is being warmed and ventilated by means of Shorland's double-fronted patent Manchester stoves, with descending smoke flues, supplied by Mr. E. H. Shorland, of Manchester.

THE ventilation of Walkerburn Church, Galashiels, has been entrusted to Messrs. Baird, Thompson & Co., ventilating engineers, London and Glasgow, who have introduced their patent "Æolus" improved invisible roof ventilators for the extraction of the vitiated air.

FOR warming the house of Dr. Henry Sydney, Staines Road, Hounslow, Mr. John Grundy's patent warm air ventilating grates are now being fixed.

THE Rural Sanitary Authority of the Hemsworth Union are taking steps to procure a provisional order for acquiring lands and easements in connection with an extensive system of water supply. Nearly a year ago the authority instructed Mr. M. Paterson, M.Inst.C.E., Bradford, to report upon a scheme of supply in and for the township of Hemsworth only. A source absolutely trustworthy could not be found within the prescribed limits, and Mr. Paterson then recommended the consideration of the question of a complete scheme for the whole union. Instructions were given and reports obtained on schemes of supply from the Pontefract Corporation and the Penistone Local Board works respectively, the water in both cases being pumped from subterranean sources, and both somewhat hard, being from 11 to 12 degrees of hardness. After due deliberation the authority have decided to adopt a scheme suggested by Mr. Paterson, the source selected by him being the works of the joint Water Boards of Dewsbury and Heckmondwike. The water is of exceptionally fine, pure and soft character from the elevated moorlands lying on the Derbyshire boundary of the West Riding, above Penistone, and quite free from liability to lead-poisoning. It is proposed to tap the Board's conduit a few miles from the source, and the supply will be by gravitation, the works consisting of a line of pipes about 15 miles long, a service reservoir at Ringstone Hill 402 feet above sea-level, and about 32 miles of distributing mains. The estimated cost is 28,000*l.*

A NEW church clock has been placed in the parish church, Uttoxeter. The clock is erected as a memorial to the late Mr. Charles Bunting, who for many years was churchwarden and one of the leading spirits of the town in public matters. The order was placed with Messrs. John Smith & Sons, Midland Clockworks, Derby, who have carried out the work to the satisfaction of the committee. The clock has two dials, each 7 feet across, which are illuminated at night. It chimes the Westminster quarters, and strikes the hours upon the large tenor bell. All the wheels are of the best gun-metal, with machine-cut teeth. Special apparatus is provided to maintain the action during the time of winding, and there is a small dial inside by which the large external hands are adjusted.

Shorland's Inlet and Outlet Ventilators in every Design.

Automatic gas apparatus is provided, by which the gaslights will be turned up and down for the varying lengths of the days throughout the year. Messrs. Smith guarantee the clock to maintain perfectly accurate time with less variation than ten seconds a month. The same firm are also now making similar large clocks for Callaby Castle, Northumberland, Little Wenlock Church, Salop, Birmingham Free Library, and others.

AMONG the numerous presents the Prince of Wales will receive on Monday next are three stained-glass windows, one given by the Queen, one by Lords Gosford, Colville, Suffield, Sir D. M. Probyn, Sir C. C. Teesdale, Sir F. Knollys, Captain Stephenson, General A. E. A. Ellis, Canon Dalton, Colonel Stanley Clarke, Captain G. Holford, Rev. F. A. J. Hervey, and Mr. M. Holtzmann, and one by Mr. F. W. Gibbs, Q.C. These windows have been designed and executed by Messrs. Heaton, Butler & Bayne, under the supervision of Sir A. Blomfield & Sons, for Sandringham Church.

THE Sneyd Colliery and Brickworks Co., Limited, of 23 Bartlett's Buildings, Holborn Circus, E.C., inform us that they have removed their depôt for glazed bricks, &c., from Maiden Lane Station to the New St. Pancras Goods Station, Midland Railway Company, entrance Ossulston Street, Euston Road, N.W., and that they are now prepared to execute orders from their stock there at the shortest notice. The depôt will be in the hands of experienced management, and all the various shapes and patterns of white and coloured glazed-bricks will be kept in stock, also large and varied stocks of fire-bricks, fire-tiles, &c. This firm have lately supplied the whole of the glazed-bricks for the new stores of Messrs. Spiers & Pond at Blackfriars Station.

A PRACTICAL demonstration of the working of "The Kennedy Dry-Press Brickmaking Machine" was recently given at the works of the Hewitt Brick and Tile Company, Limited, Southall, near London. It is simple in construction and substantially built of the best of material; every shaft and pin in it is of the best steel and the framework exclusively iron; the entire strain of pressure comes upon two heavy wrought-iron bars entirely independent of the framework; the pressure is made by four compound lever-power of the first order, the only press-brick machine having levers of the first order. The machine makes four bricks at each pressure, discharging the same on a receiving-table at the rate of forty-four bricks per minute, the daily capacity amounting to 26,400. The mould-table is stationary, and the moulds are made of the best hardened steel, highly polished, in order to give bricks that superior finish so essential to first-class fronts. The machine is strictly automatic, self-feeding and discharging. It is claimed for the bricks that they are superior to those made the old way. They go direct to the kiln from the press, thereby avoiding additional and expensive handling. The bricks can be set as high in the kiln as is desired for burning, forty being the customary height. The bricks are warranted to stand more crushing weight than those made by the old process, and are much more easily and rapidly laid in the wall from the fact of being of uniform size and thickness; the mason does not lose time in reversing the bricks, hunting for the thick and thin side of same, as is usual with mud-made bricks. The machine can be operated all the year round, independent of the weather, as all work is done under shelter. It will work successfully in any dry or semi-dry clay having brick-making qualities; it will work fire-clay and the refuse of slate quarries. It can be regulated so as to increase or lessen the pressure, or increase or lessen the quantity of clay without stopping the machine. The moulds of the machine are heated, thus obviating the necessity of stopping to clean the same, leaving the moulds as clean after a day's work as they were at the beginning. The machines are extensively used in the United States.

VARIETIES.

CONSIDERABLE progress has been made with the excavations now being carried out for Lord Bute, under the superintendence of Messrs. Kempson & Fowler, of Llandaff, on the site of the old Blackfriars Monastery, which is within the Castle grounds. Many parts of the old foundations have been traced, a piece of the original consecrated altar slab has been found, also many interesting fragments of tombs, pieces of worked stone, glass, tiles, &c., all of which have been carefully preserved.

A LARGE and handsome memorial brass, to commemorate the tercentenary of Sir Richard Grenvile's death from wounds on board the Spanish galleon *Sant Paule*, has been erected in Bideford Church by his lineal descendant, Rev. Robert Granville, the rector. The brass is about 4 feet in length by 3 in width, with a suitable border, and in the centre of the top are the arms of the Grenvile and St. Leger families, with the motto "Deo Patriæ Amicis." The inscription is in a clear Old English text, and is as follows:—"About the 4th of September, A.D. 1591, died of his wounds on board the Spanish galleon the

MANSFIELD STONE,

FROM THE "LINDLEY" QUARRIES MANSFIELD.

Sant Paule off the island of Flores in the Azores having in H.M.S. the *Revenge* endured in a fifteene houres fight the assault of fifteene severall Armadoes all by tournes aboorde him and by estimation eight hundred shot of great artillerie, besides manie assaults and entries, Sir Richard Grenvile, Knight, Vice-Admiral of England, aged 48." The translation of his last words, spoken in Spanish, were these:—"Here die I, Richard Grenvile, with a joyful and quiet mind for that I have ended my life as a true soldier ought to do, fighting for his Country, Queen, Religion and Honour; my soul willingly departs from this body leaving behind the lasting fame of having behaved as every valiant soldier is in duty bound to do. A fight memorable even beyond Credit and to the Height of some Heroicall Fable." The brass has been designed and executed by Messrs. Pratt & Sons, Tavistock Street, Covent Garden. It forms a fine memorial, and the whole of the work is carefully carried out.

A SUM of 50,000*l.* has been raised by private subscription for the proposed new art galleries, Glasgow.

TOWARDS the building of a new cathedral church at Swansea Sir John Llewellyn has offered 1,000*l.* in three years, on condition that the work is taken up vigorously and that a substantial and worthy building is erected.

THE Joint Rivers Committee, charged with the task of preventing the pollution of the Mersey and Irwell, have appointed Mr. R. A. Tatton, civil engineer, of Manchester, to the office of general inspector, at a salary of 600*l.* per annum. Four sub-inspectors have also been appointed.

THE County Council of Kirkcaldy have decided to write to the North British Railway Company asking them to put all their bridges on the highways in the district and crossing their line in such a sufficient condition to allow traction-engines to cross them. The company were bound to keep the bridges in such a state as to safely conduct ordinary traffic. The notices on these bridges pointing out that traction-engines could not pass over them was considered illegal.

MR. PLUNKET, First Commissioner of Works, has written to Mr. F. Dethridge, clerk to the Paddington Vestry, stating that it is proposed to form a new entrance for equestrians into Hyde Park, opposite Albion Street, and asking whether the Vestry will, at the ratepayers' expense, effect the necessary alterations to the roadway and footway outside the park.

THE *Leeds Mercury* understands that Messrs. Webster have decided to accept the sum of 33,000*l.* which the Leeds County Council at its last meeting resolved to offer for the Quebec Buildings, opposite the Queen's Hotel.

THE death is announced, suddenly, of Mr. W. B. Scott, C.E., at his residence, Church Row, Hampstead, in his 70th year. Mr. Scott occupied the position of chief surveyor to the Vestry of St. Pancras for thirty-three years. The many public improvements that have taken place in the parish during the past twenty years have all been under Mr. Scott's supervision, and he was attending to his public duties within a few hours of his death.

IT has been notified to the subscribers of the Kilmarnock Infirmary that two ladies have offered to give 1,000*l.* each for the endowment of two cots in the infirmary.

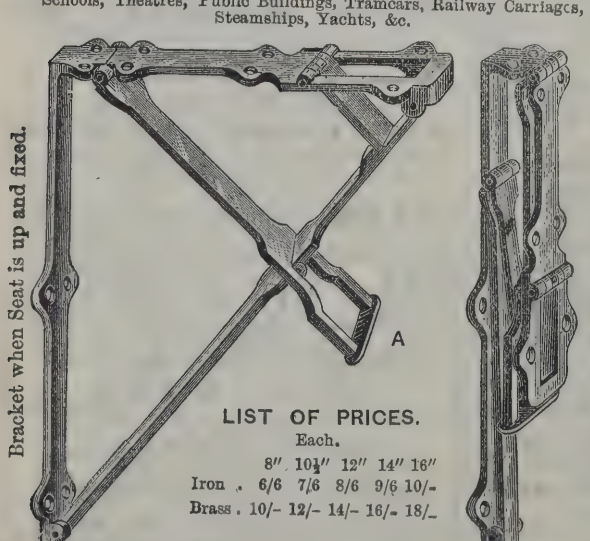
ON November 16, Mr. Gilbert Dalziel will publish "Judy's Annual" for 1892, which this year is entitled "Girls up to Data." The book will contain thirty-five letters written by thirty-five girls to Maud, the lady who is responsible for the work. The portrait of each fair damsel is given, sketched either by Wm. Parkinson or by J. Bernard Partridge.

THE directors of the London, Brighton and South Coa Railway purpose greatly enlarging their terminus at Victoria Station.

THE *Scotsman* says that in consequence of the representations that have recently been made to the Government with regard to the condition of the Palace of Linlithgow, the Secretary for Scotland, accompanied by Mr. Cochran Patrick and Mr. Robertson, of the Office of Works, have visited the burgh and made a careful inspection of the building.

IN connection with a proposal to enclose and beautify the Castle grounds at Knaresborough, for the town, the Improvement Commissioners have confirmed a resolution passed by the committee, that it was desirable to advertise for competitive plans to carry out the proposed improvements, and sanctioned the payment for the best and second designs.

THE executors of the late Dr. Beaney, who by his will bequeathed ten thousand pounds to the city of Canterbury for a free library, have been advised that the legacy is void under the Statute of Mortmain. The Mayor of Canterbury has instructed a Melbourne lawyer to represent the interests of the citizens in the action pending in the Melbourne Law Courts.



THE Durham County Council have adopted a scheme for allocating the Government grant for technical education in the county. The total amount of the grant is estimated at 25,000*l.*

MELBOURNE INTERNATIONAL EXHIBITION, 1880-81,

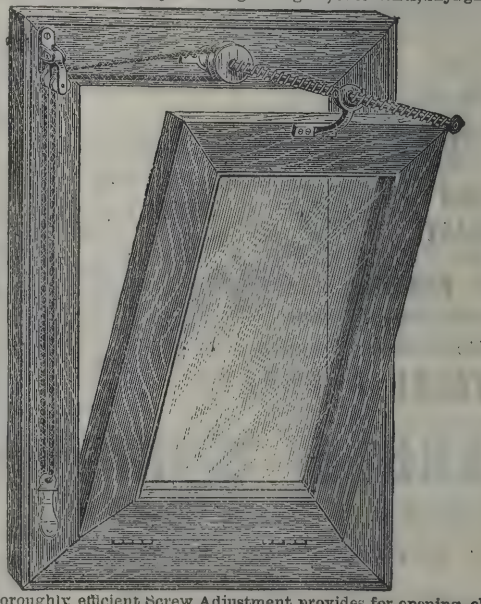
CABINET BUILDERS AND NAVAL BRASS FOUNDERS,
BIRMINGHAM.
LONDON SHOW ROOMS: 57 HOLBORN VIADUCT, E.C.

SPECIALTIES:

GROOMBRIDGE'S Patent SELF-ADJUSTING BRACKET,
For Seats, Shelves, Tables, &c. Specially adapted for use in Churches, Chapels, Schools, Theatres, Public Buildings, Tramcars, Railway Carriages, Steamships, Yachts, &c.



LIST OF PRICES.
Each.

	8"	10½"	12"	14"	16"
Iron	6/6	7/6	8/6	9/6	10/-
Brass	10/-	12/-	14/-	16/-	18/-

The Advantages of this Patent Bracket are that it can be raised or lowered by the action of only one hand. It is automatic and perfect in action, and the extreme simplicity of its arrangement prevents any possibility of its getting out of order.

PRESTON'S Patent SCREW ADJUSTMENT,
For opening, closing, and securely fastening Fanlights, Casements, Skylights, &c.

	each.
A666, ⅜-inch Rod × 12 inch. Lighter. All Brass .. .. .. Brass Wheel, Iron Fittings	6d. 8d. 7s. 6d.
A749, ½-inch Rod × 18 inch. All Brass .. .. .. Brass Wheel, Iron Fittings	11s. 6d. 10s.

This thoroughly efficient Screw Adjustment provides for opening, closing, and securely fastening Fanlights, Casements, &c., and will by its extreme simplicity commend itself to Architects, Builders, &c.

Working Models of the above and other Specialties may be seen at our new Show-Rooms 57 HOLBORN VIADUCT, E.C. Architects and Builders are invited to inspect same.

The Rhyl Improvement Commissioners propose to purchase the waterworks undertaking, and to improve the water supply.

Excursions for the working-classes and others to the Chicago Exhibition of 1893 are being arranged for by the Committee of the Polytechnic Institution, Regent Street. A week will be allowed in Chicago, and places and cities of interest will be visited on the way and in returning.

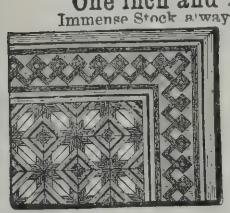
At the monthly meeting of the Sale Local Board the Public Works Committee recommended that the solicitor to the Board should take proceedings to enable them to acquire fifteen acres of the Priory estate for the purposes of sewage disposal. The cost of the scheme, as first proposed, was 12,722*l.* By a later scheme the estimated cost is 16,083*l.*

A railway bridge across the Nile at Embabeh, which has just been constructed by some French contractors, has been declared defective. One of its nine piers is to be rebuilt, and portions of the ironwork are to be replaced at the contractors' expense.

Three new branch schools of art are to be opened in Birmingham on Monday—one at the Board School in High Street, Harborne; one at Highfield Road, Saltley; and one at Tindal Street, Balsall Heath. This brings up the number of branch schools of art to fourteen.

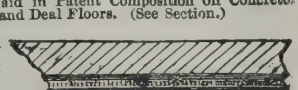
The Birmingham Board of Guardians have adopted a resolution, "That no contracts be in future placed by the Board with any person or firm not paying the regular or standard rate of wages."

NEW CATALOGUES.



We have received from Messrs. Townshend & Co., of Birmingham and 62 Holborn Viaduct, London, their illustrated catalogues of latest productions in art metalwork. The catalogues are beautifully printed, and it is clearly to be seen that an immense amount of care has been exercised by all concerned in the production of the illustrations, every detail of ornament, even to the most minute, being rendered so truthfully. The useful and ornamental furniture and appliances connected with fireplaces and connected with lamps cannot be too highly commended. These are only a portion of the large variety of articles connected with those furniture appliances in which the public look for artistic treatment. To mention only one article of fireplace furniture: in the fenders alone a wonderful variety of artistic excellence is visible. The articles necessary and useful, and also those convenient and luxuriant—which, where economy has to be studied, can be dispensed with—cover so large a field that we recommend all interested in adorning their homes with tasteful furniture to consult the catalogue for themselves.

A LAND SALE ON THE SURREY HILLS.



Favoured by propititious weather, which came as an enjoyable relief after the previous long spell of wet, and amidst some of the loveliest scenery in the kingdom, there took place on Wednesday of last week at Chelsham, in Surrey, a sale by auction of a number of freehold plots of land, two acres each and upwards, the property of the Lands Allotment Company, Limited, and forming portion of an estate containing altogether about 1,100 acres, situated on the Surrey hills, adjoining Worms Heath, at an altitude of something like 800 feet above the level of the sea, where the salubrity of the atmosphere is strikingly manifest. The journey to Marden Park Station, which is only seventeen miles from London, occupied about forty minutes, and carriages were in waiting to convey the company of intending purchasers and others from thence to the estate, which proved to be a short and romantic drive. The country round about being well-wooded, the autumnal tints lent an additional charm to an almost unsurpassable landscape. After being driven as far as Chelsham Court and over the whole estate, from which magnificent views across the counties of both Surrey and Kent are obtainable, the company were invited into a farmhouse building, where a substantial luncheon was partaken of, and to which it goes without saying ample justice was done by those present, to whose appetites the "caller" air had naturally imparted a keen edge. After removal of the cloth, Mr. George Newman, the surveyor and auctioneer to the Lands Allotment Company, who (in conjunction with Messrs. C. & F. Rutley) conducted the sale, explained the various stipulations and conditions laid down, which were deemed to be fair and reasonable, and then the bidding commenced. Only a few lots, however, changed hands at prices averaging about 100*l.* per acre, and the remainder were eventually withdrawn, but it is understood that there are numerous inquiries after the unsold lots, which are being dealt for by private treaty, and a marked disposition was manifested to acquire lands of such an exceptional character, divided into plots suitable either for the erection of houses or small villa-

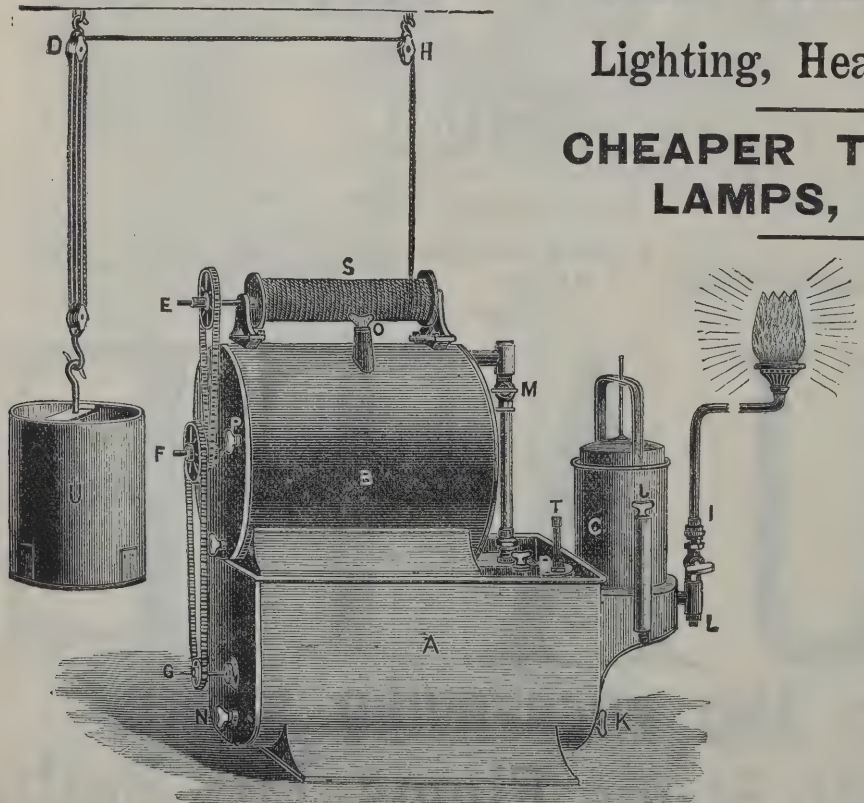
farms, within so convenient a distance of the metropolis and with so many advantages appertaining, not the least of which is the fact of the Chelsham and Woldingham Waterworks, from whence a supply of remarkably pure water is obtainable, being in close proximity to the estate.



ROBERT DINNIE, MASON AND ARCHÆOLOGIST.

MR. ROBERT DINNIE, poet, author and antiquarian, and father of the famous athlete, Donald Dinnie, died on October 29 at Wood Cottage, near the village of Kincardine O'Neil. Perhaps no one was better known in his day and generation on Deeside, says the *Aberdeen Free Press*, than Mr. Dinnie, and probably no name is more familiar in the athletic world than his through the physical prowess of his son, who has for so long carried the palm at every athletic meeting, not only in Scotland but wherever Scotsmen gather. In the death of Robert Dinnie or, as he was more familiarly called by his immediate neighbours, Robbie Dinnie, a character of no mean note has passed away, and one of the few remaining links between the past and present has disappeared. Robert Dinnie was not only noteworthy as the progenitor of the world's champion athlete, Donald, and a race of giants besides, but he was himself, as far as physical prowess was concerned, a giant, although the idea of winning fame by such in the public arena was as antagonistic to his nature as idleness was to his active life. As a country mason he boasted that in the heyday of his strength he did the ordinary work of two men, and the boast was no empty one, as many who have laboured to him on Deeside testified, and yet in the midst of all this toil he found time to earn a fame of more than mere local renown as a poet, author and antiquarian. He has passed away at the ripe age of eighty-three. He met with an accident a few weeks ago which hastened his end. Robert Dinnie was born in the parish of Birse in 1808, and, after receiving a good elementary education at the parish school, where in the closing days of his school career he acquired a liking for English classics, which developed into a hobby in after years, he served his apprenticeship as a country mason, at which craft he laboured generally on his own account, building farm-houses, steadings, kirks and schools till over the three score years and ten, when age alone compelled him to lay aside the trowel. The monument on Mortlach, near Aboyne, to the late Marquis of Huntly—and the most conspicuous on Deeside—was built by Dinnie, as also the granite Gothic crown at Invermark, where the Queen and Prince Consort rested and took refreshment after crossing Mount Keen on their last excursion from Balmoral together incognito. Most of Mr. Dinnie's "jobs" were to the order of the late Fox Maule, Earl of Dalhousie, and the late laird of Ballogie. These were his chief patrons. Mr. Dinnie's antiquarian knowledge was wide. He early began to make himself acquainted with the traditions and history of the districts in which he lived and worked. He was ever eager to examine old buildings, or coins, or seals, or whatever was ancient or curious, so that from far and near he was regarded as an authority in this line, and his opinion freely asked on any antique "find" or purchase was as freely given. He spared himself no pains or trouble in solving a mystery, and his correspondence in this direction was extensive, his correspondents being not unfrequently the highest authorities in the land. His antiquarian museum, occupying the upper part of his cottage where he resided for the most part of his life, in a wooded glade on the estate of Ballogie, near the banks of the Dee, contained an extensive and valuable collection of "Ferrara" swords, dirks, old Scotch coins, flint arrow-heads, axe-heads, old chairs, old Scotch measures, buttons, tokens and other treasures dear to the heart of the collector, and was at its best some twenty years ago, and since then the rarer specimens have been parted with from time to time till scarcely anything of note now remains to be disposed of. Old castles were a favourite haunt of Robert's in his day, and of these and other ancient and historical buildings, far and near, he had an intimate and probably unique knowledge. His memory, till very recently when weakened by disease, was full and accurate. Once put on the track of a subject, and he would recall the minutest details and exact dates. He had met "Old Dubrach," who was 108 years old at the time when Mr. Dinnie was a boy. This old man was the last of the rebels who were out in '45, and was presented to George IV. on his visit to Edinburgh in 1822 as his last enemy. Thus Dinnie's death severs a very interesting connection with the past, as perhaps he was the last who had ever seen a rebel in the flesh, who had a personal knowledge and connection with the Bonnie Prince Charlie. He utilised his antiquarian knowledge in book form, for he had a strong literary faculty. He produced from time to time "The History of Birse," "The Deeside Guide," "Cauld Kail Het Again," "Stories of Joseph Smith, some time Minister of Birse," and "History of Kincardine O'Neil"—small volumes but rich in local historical lore, and all written after he was

THE "HELIOS" GAS-MAKING MACHINE

FOR

Lighting, Heating, and Motive Power.

CHEAPER THAN COAL GAS, OIL LAMPS, OR ELECTRICITY.

This Machine is the latest development of the Oil Gas systems. In most other such machines Gasoline is the gas-producing material, and as this can only be procured in large quantities, and is dangerous to store, there is naturally a great objection to its employment. The "Helios" Gas Machine is charged with Benzoline, which can be procured anywhere in large or small quantities. The Machine is simple, and the light produced far superior to coal gas. Machines made to supply from 6 to 2,000 lights.

Prices from £10 10s.

UNEQUALLED FOR

COUNTRY HOUSES, FACTORIES, HOTELS, &c.

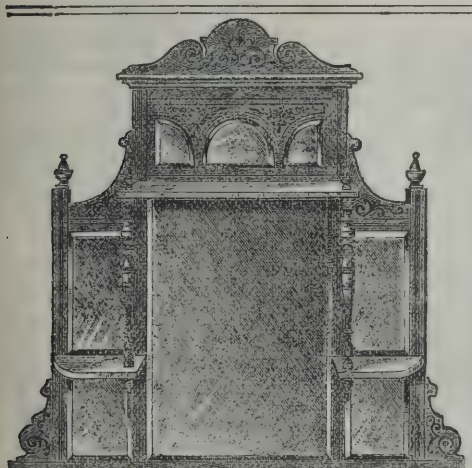
THE INCANDESCENT GAS LIGHT CO., LIM..

14 PALMER STREET, WESTMINSTER



sixty years of age. Most of these are now out of print. He was also a rhymer of no mean ability, and in 1876 he published a volume of "Songs and Poems," which contained what he himself regarded as his better productions, most of them having been written from time to time as the incidents they related cropped up. Perhaps the best piece he ever wrote was his address to the "Auld Kirk of Kincardine O'Niel." In this connection it may be noted that in dress he affected the poet Hogg, for whose writings he had a great admiration. It may be mentioned that all through life, and even to the last almost, his chief food, and which he delighted most in, was water brose, with ale or milk. He was married when twenty-five years of age, his wife being two years his junior, and she predeceased him only a few months ago. They had ten of a family—six sons and four daughters—all of whom are alive. Donald is the eldest of the sons but the third of the family. He was born near the village of Kincardine O'Neil, but in the parish of Aboyne, in the year 1837, and is thus fifty-four years of age. He is at present in Australia, whither he went from America several years ago. The old couple were always proud of their eldest son's achievements, and nothing delighted them more than to talk about Donald's feats with the hammer, the stone or the caber. In keeping with the character of the man, it was only to be expected that he would have all arrangements made, even to the minutest details, in view of his death, and these were from time to time reduced to writing. His head-stone was prepared long ago.

FIRE AT SANDRINGHAM.

THE fire which broke out on Sunday morning at Sandringham, the Norfolk residence of the Prince of Wales, has caused damage that is estimated at from 10,000*l.* to 15,000*l.* The bedroom in which the fire originated is on the nursery floor, nearly at the top of the house. At about 7·30 a letter-carrier named Emmerson saw smoke issuing from the upper storey windows of the main portion of the hall, and immediately communicated the fact to the police-constable on duty, and instantly an alarm was raised. It was soon seen that the whole suite of unoccupied apartments in that part of the building was in flames, and the destruction of the entire building seemed inevitable.

The Prince of Wales purchased the Sandringham estate in 1861 from the Hon. C. Spencer Cowper for 200,000*l.* At that time the house conformed to an ordinary type of old English country residence, and occupied three sides of a square. Soon after His Royal Highness came into possession of the property the house was pulled down, and the present mansion was erected on an enlarged site, the work being completed in 1871. The style was a modification of the form of Elizabethan architecture which appears in many of our manor houses. Comfort rather than luxury seems to have been studied in the arrangements, and with success. The structure extends in length some 500 feet, of which one-half is occupied by the main building, and it is about 60 feet wide. On the ground floor is a continuous suite of dining-rooms, boudoirs, drawing and breakfast-rooms, with a lofty entrance-hall which has served at times as a ball-room, having an enriched gallery at the north end for the orchestra. The decorations of the interior hall and the principal staircases were of English carved oak with enrichments in the Elizabethan style, whilst the drawing-rooms and boudoirs were very delicately and beautifully decorated in the French style. On the first floor were the Queen's Room, the Prince and Princess of Wales's bedroom, the Bamboo-room, the Prince's Cabinet, the White Library, and visitors' and other rooms. The second floor was on iron girders and concrete in order that this suite of apartments might be as fireproof as skill could make them, and it is due to this fact that the whole range of buildings escaped destruction. Upon the third floor were the rooms used by the ladies associated with the royal household. These latter were partly constructed in the open timbered style, and the space beneath the floor and the ceiling below was filled in with sawdust to deaden sound.

The Prince of Wales was expected at Sandringham on Saturday next, and preparations were in active progress for his reception. Fires had been lighted in all parts of the house, and it is surmised that a spark from one of the flues had in some way communicated with the woodwork and had probably been smouldering all night. In about an hour after the alarm was raised the top of the building was all in flames, which could be seen for miles around, and soon after that the roof fell in with a tremendous crash. By 11·30 A.M. the fire was fairly got under. In the meantime a gang of men had been engaged in removing the most valuable goods from the lower rooms and placing them on the lawn, whence they were removed to a place of safety. The upper part of the building and the rooms on the second and third floors were entirely gutted and their contents destroyed, whilst the rooms below were much injured by water. The following are the insurances:—buildings, 59,000*l.*; contents, 68,400*l.*; total, 127,400*l.*

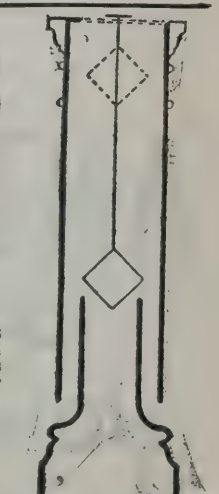
"CLIMAX" VENTILATING CO.'S

DIRECT ACTING

CHIMNEY COWL,



For the Preventing a Blow-down.

This Cowl is specially designed for preventing a blow-down and assisting the up-draught. It is admittedly the most efficient in the market. Its construction is scientifically and mathematically correct, and no matter from what direction the wind strikes it, a powerful upward current is established. It is noiseless, has no movable parts to get out of order, is easily cleaned, the cone over inner shaft being made to push up. It has THE very decided advantage over every other Cowl, IT IS SIGHTLY.

PRICES AND PARTICULARS ON APPLICATION.

THE "CLIMAX" VENTILATING CO.,

15 GREAT GEORGE STREET WESTMINSTER, S.W.

A later account states that arrangements are being made to restore Sandringham House to such an extent that the festivities connected with the Prince of Wales's jubilee birthday need not be interfered with. One hundred decorators and carpenters are at work repairing and cleaning the interior of the building. A temporary roof of wood and patent sheeting is being constructed over the part damaged by fire, at a sufficient height to admit of the premises being rebuilt without disturbing it. Colonel Edis is arranging for the restoration of the upper storeys of the main building, the damage to which it is now positively asserted will be covered by less than 10,000*l.*

REGISTRATION OF PLUMBERS.

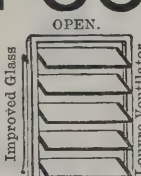
THE Mayor of Londonderry, Mr. A. Baxter, J.P., presided at a public meeting held in the Guildhall, Londonderry, for the purpose of electing a local organisation to carry out the national system of registration of plumbers in that district. There was a large and influential attendance, including Dr. Walter Bernard, Alderman J. B. Johnston, W. J. Robinson, A.M.I.C.E., city surveyor and executive sanitary officer; Councillor J. A. MacCullagh, M.D., consulting officer of health; R. Eccles Buchanan, architect; W. E. Crowther, master of the Science and Art School; and a number of master and operative plumbers, including Mr. Edward Winnington, R.P.C., who attended to represent the District Council at Belfast.

The Chairman, in introducing Mr. Winnington to the meeting, mentioned that the clerk of the Worshipful Company of Plumbers had specially visited Londonderry with Mr. Winnington to make arrangements for that meeting, but had not been able to stay and address them, owing to important engagements in London.

Mr. E. Winnington said the education and registration of plumbers was a great public question. It had been affirmed by the most eminent medical authorities, by architects and by sanitarians generally, that the work of the plumber, if badly done, either in plan, construction or execution, was very dangerous to the health of the community; but that if, on the other hand, it was well done, it contributed very materially to the public comfort and health. In support of this statement, the speaker quoted a number of eminent authorities. Referring to the advantages of registration to the plumbers themselves, he pointed out that it would eventually be of great benefit to them to join the registration movement, as by so doing their trade would in the course of time be elevated to the dignity of a respectable profession, and when good work was required to be done the public would have a reliable list of qualified men whom they could trust to do the work on the most approved sanitary principles. Touching on the question of technical training, Mr. Winnington said it was impossible to separate technical training from the registration movement. The one must necessarily accompany the other.

After an interesting discussion a formal resolution was passed inaugurating a local committee for Londonderry, composed of an equal number of master plumbers, operative plumbers and public representatives, including the Mayor, Dr. Bernard, Dr. MacCullagh, Alderman McLearn, Mr. James Craig, Mr. R. Eccles Buchanan, Mr. W. J. Robinson, Mr. F. G. Ferguson and Mr. W. Barker. Mr. W. E. Crowther, Science and Art School, was appointed secretary *pro tem.*

SOURCES OF THE LONDON WATER-SUPPLY.



A REPORT has been prepared by Mr. A. R. Binnie, the chief engineer of the London County Council, upon the London Water Supply, with special reference to the quality and quantity to be derived from the Thames and the Lea. Mr. Binnie states that the average quantity of water abstracted from the Thames for the supply of London in 1858 amounted to 35,387,000 gallons per day, and was increased in 1890 to 90,400,000 gallons per day, showing a rise of over 154 per cent. during that period. Looking back to the report of the Royal Commission of 1869, he finds that the quantity authorised to be abstracted at that period was 110,000,000 gallons per diem. Considerable obscurity exists as to how that quantity was authorised, and as to how it has since been increased. That the maximum quantity which may safely be drawn from the river has been reached is shown, Mr. Binnie says, by the fact that the quantities abstracted in August, 1885, amounted on an average to 31¾ per cent. of the total flow, and on August 3 of that year to 37 per cent. of the total volume, and the average quantity abstracted in August, 1887, amounted to 29·65 per cent., and on the 14th of that month to 39·6 per cent. If further abstraction of water is not carefully guarded against, Mr. Binnie fears that a state of things may arise most unpleasant and disastrous to the inhabitants of London. The quantity actually abstracted by the companies averaged for 1890 90,400,000 gallons

GROVE WORKS, BATTERSEA. LONDON S.W. (Export Office:—15 Victoria Street, Westminster) **& BACHELOR'S WALK, DUBLIN.**

a day, and in dry weather often exceeded 100,000,000. After discussing the question of the control of existing companies by the Local Government Board, and stating that the powers of control were far more limited than the companies would wish the public to believe, Mr. Binnie deals with the rapid increase of the population of the Thames Valley, living in towns and villages that must inevitably drain directly into the streams and river from which the inhabitants of the metropolis receive their drinking water. Discussing the question of the possible future increase of the supply by means of storage-reservoirs, he says that he can safely say that he knows of no sites in the Thames Valley suitable for storing water for the domestic supply of London. He holds out little hope of obtaining chalk and other spring water in the Thames Valley or of obtaining supplies from the gravel beds there. Coming next to the Lea, the report states that the companies, who claim the right to draw an unlimited quantity of water from that river, actually abstracted from it in 1858 40⅔ million gallons a day, and in 1890 about 72,800,000 gallons a day. Of the latter amount probably 13¼ million gallons were drawn from deep-seated springs by means of wells and pumping. Facts are mentioned to prove that the companies could not draw the full quantity they required from the Lea, and that they already drew more than was desirable, and Mr. Binnie expresses the opinion that the construction of reservoirs in the valley of the Lea would be impossible. The report proceeds to deal with the question of the pollution of the Thames and Lea valleys, and gives details of diseases that have resulted from polluted water supplies at the following among other places:—Lausen, Nagpoor, Madrid, Seville, Valencia, Granada, Theydon Bois (near Epping), Guildford, Lewes, Bangor, Hitchen, Doncaster, and lastly, London. After dealing briefly with the supplies of other large towns, Mr. Binnie concludes thus:—"To my mind the whole question is not one requiring to be elucidated by chemical analysis. I consider that the facts given in this report, supported as they are by the evidence of high authorities, are sufficient to throw deep suspicion on the London water supply, derived as it is from such questionable sources. I cannot but concur with the report of the Royal Commission on the Pollution of Rivers (Domestic Water-supply of Great Britain), 1874, which, in referring to the water-supply of London from the Thames, states at page 429:—'We, therefore, recommend that the Thames should as early as possible be abandoned as a source of water for domestic use, and that the sanction of your Majesty's Government be in the future withheld from all schemes involving the expenditure of more capital for the supply of Thames water to London.' It will now be for the Council very gravely to consider, with these facts before them, what course they will adopt with regard to the future water-supply of London from the rivers Thames and Lea. At present, no doubt, the death-rate of the metropolis is low, and as far as analysis is concerned the water appears to be wholesome. But it has been shown that analysis, without the previous history of the water is taken into account, is no guarantee of purity, and it is evident that the inhabitants of London are living under conditions as to their water-supply which might lead to an outbreak of epidemic disease that for extent and severity would be almost unparalleled in the history of the world. And there are serious reasons, on entirely other grounds, for limiting the supply derivable from the Thames and Lea, even were those waters considered perfectly pure and wholesome."

THE BLACKWALL TUNNEL.

THE subject of the Blackwall Tunnel came before the London County Council this week. The Bridges Committee reported that the Council on October 13 referred to them the following tenders for the construction of this tunnel:—Messrs. Hugh Kennedy & Sons, 1,112,160*l.* 6*s.* 3*d.*; Mr. J. Jackson, 1,018,812*l.*; Mr. W. Webster, 974,580*l.* 8*s.*; Messrs. S. Pearson & Son, 871,000*l.* Messrs. S. Pearson & Son, whose tender was the lowest, were contractors of high standing, and were now engaged in satisfactorily completing the Hudson River Tunnel at New York by compressed air with a pneumatic shield, under the direction of Sir Benjamin Baker, the method of construction being similar to that proposed to be used in constructing the Blackwall Tunnel. The committee recommended that, subject to an estimate being submitted to the Council by the Finance Committee, in accordance with the statute, the tender of Messrs. S. Pearson & Son for the construction of the Blackwall Tunnel, amounting to 871,000*l.*, be accepted, and that the solicitor be instructed to prepare the necessary contract.

Mr. Hunter moved the reception of the report. He stated that three-fifths of the population of the metropolis lived west of London Bridge, and they had twelve bridges constructed at a cost of six and a-half millions sterling. On the east side of London Bridge there were two-fifths of the population, and there were no means of communication at all. Certainly they should shortly have the Tower Bridge, but that was only half a

mile below London Bridge, and they had the Woolwich Ferry, which was some considerable distance below. The use which had been made of the Woolwich Ferry was one more proof that communications between the north and south sides of the river were urgently required. The principle had been practically accepted, because all other means had been rejected. The Council had either bought or entered into arrangements for the purchase of property of the value of 365,000*l.*, and if the tunnel scheme were abandoned that would have to be sold at ruinous loss. They had a tender from practical contractors experienced in the work, and in the public interest it was desirable that the question should be settled at once.

Mr. Myer was anxious to see improved accommodation between the banks of the river, but he asked whether such improvements as the widening of the Strand, Bozier's Court, the new street from Holborn to the river, and other pressing improvements were to be put aside while they were spending an enormous sum in carrying out this tunnel, which he predicted would be a failure. He moved as an amendment :—"That inasmuch as there are greater and more important improvements absolutely necessary nearer central London (and which, if effected, would cost considerably less), this Council adheres to its former declared policy of not undertaking further improvements until the incidence of taxation is altered so as to place the burden of the cost upon those who derive the benefit, viz. the owners of the land in the immediate district, the Council, therefore, regrets that, although it is desirous of effecting a communication across the river at Blackwall, it cannot at present proceed with so gigantic an undertaking."

Mr. Arthur Arnold, who seconded the amendment, questioned whether the tunnel would be of much use for heavy traffic, because the gradients as now proposed involved a descent of 72 feet, whereas the height of the Tower Bridge over high-water mark was 33 feet, and, therefore, would be preferred by drivers. The Woolwich Ferry experiment had been most successful, and they might try a ferry at this place instead of constructing a tunnel, which was doomed to be a wasteful failure. If they had a million of money to spend why should they delay the Strand improvement, which was much more pressing than this?

Mr. Collard contended that the tunnel was altogether unnecessary in this neighbourhood.

Mr. Lidgett said it was nearly three years since their predecessors declined to construct this tunnel, and the Council were bound to proceed with it. All the population in the East End of London were in favour of it, knowing what an enormous gain it would be to them if they could pass from one side of the river to the other by a road which should be open and lighted day and night.

Mr. Beachcroft was opposed to the tunnel, but they had now gone so far that they could not retreat. In good faith they were bound to go on and carry out the project which they had already decided upon.

Mr. Burns pointed out that, though those using the tunnel would have to descend 72 feet, they would, if they used the Tower Bridge, have to make a journey of five miles on each side of the river, and, therefore, if the gradient of the tunnel were made moderately easy, it would be used for all heavy traffic in the locality. The industries of the district could not be developed, in his opinion, by a ferry.

The amendment was then put and negatived by a large majority.

Mr. Saunders then moved the following amendment :—"That, as the lowest tender for a single tunnel is far in excess of the Parliamentary estimate, the tender be not accepted, and that it be referred to the Bridges Committee to take advice as to the possibility of reducing the cost and improving the communication by the adoption of shafts and lifts instead of inclines." He contended that the system of lifts would effect an enormous saving of expense and would give them a much more satisfactory tunnel.

The amendment was rejected and the recommendation of the committee agreed to, only eight members dissenting.

THE ARTESIAN WELL IN THE CITY.

AT the last meeting of the City Commission of Sewers Colonel Haywood reported that the artesian well at the Artisans' Dwellings in the Minories had been bored to an additional depth of 100 feet, making 450 feet in all, the average daily yield being 50,000 gallons. He recommended that the boring should be continued for another 100 feet deep. Mr. Malthouse said he did not intend that this new supply of water—which was independent of the companies—should be confined to the Artisans' Dwellings alone. It might be the means of supplying the surrounding district and the commencement of a new supply for the whole City, but, at all events, it would be a great factor in considering the value of the water companies' property when any purchase was in contemplation. He moved that the

additional 100 feet recommended by the engineer should be bored. The engineer said the cost would be 1*l.* 10*s.* per foot. Mr. Wallace suggested that there was a danger in such additional boring, as the supply might suddenly cease. Mr. Sly said there might be matters of a legal and an engineering character which it would be desirable to inquire into before proceeding further. Mr. Deputy Bedford said the water companies had no monopoly in the City of London, whatever might be their position outside. Mr. Malthouse said there was no fear of a cessation in the supply, as the water-bearing strata went to a great depth. The motion was carried, and it was further arranged that Dr. Sedgwick Saunders, the medical officer, should analyse the water and make a report as to the result at the next meeting.

THE INCIDENCE OF TAXATION.

The Local Government and Taxation Committee of the London County Council have presented a report which has been prepared by a sub-committee containing an elaborate exposition of the law on the subject of rating as applicable to London, and an examination of various principles connected with it and of various methods proposed for its reform. The committee, at the conclusion of their report, summed up the propositions which seemed to them to be correct as follows :—

1. Some portion of the burden of the rates should be thrown on owners as distinct from occupiers.
2. All owners, of whatever tenure, whether for years or for life or in fee, should bear their due share.
3. Each owner should be charged upon the present amount of annual benefit accruing to him from the property assessed.
4. Each owner should pay part of the rate collected from the occupier by means of a deduction from his rent, according to the method used in the case of property-tax.
5. Owners should contribute to the rates not only in respect of improvements, but of other purposes.
6. Owners should pay not different proportions of rates levied for different objects, but a fixed proportion of the whole.
7. A fair proportion should be charged upon owners.
8. Half is suggested as a fair proportion.
9. The Council should suggest principles only, without attempting a detailed plan.
10. New taxes may be imposed without regard to private contracts.
11. Contracts which contain no stipulations that the occupier shall pay rates need not be regarded.
12. Future contracts by lessees to pay otherwise than as the law directs should be made void.
13. Future increases of old rates may be treated as new taxes.
14. Rates existing at the date of a contract should be left under the operation of the contract.
15. Rates or increase of rates imposed after the date of the contract and before the change of law require special treatment.
16. Some compromise is necessary, as suggested by the committee of 1870, but it should be more speedy and wider in its operation.

Their present recommendations were :—(*a*) That the Council do accept this report as an exposition of many questions relating to local taxation in London, and as propounding principles of reform worthy of the attention of Parliament. (*b*) That the report, if adopted by the Council, and the accompanying papers be sent to the Local Government Board, the vestries and district boards, the City Commissioners of Sewers, the boards of guardians, the London School Board and the Asylums Board.

THE CROSS-RIVER BRIDGES OF GLASGOW.

It has been remarked by some one of great discernment as a singular, but singularly fortunate, accident that rivers should so often flow past large towns. For no city in the kingdom, says the *Glasgow Herald*, has "accident" been more fortunate in that respect than for Glasgow. The stream of Clyde is not pellucid, but it has borne us along to fortune, and it intersects what is now admittedly the second city of the kingdom—although hardly the second city of an Empire which includes India. This matter of intersection, though, is one of the results of the "accident" of riverine courses. Once upon a time the Clyde flowed more or less tranquilly past Glasgow; now it flows through it. The history of a people, it has been said, is written in the stone of its buildings and monuments. The history of industrial Glasgow is written largely in its bridges, and it is worth a retrospective view at a time when one chapter of it is about to be rewritten. At the present day, between the eastern boundary of the city and the open harbour, the river is spanned by nine separate bridges, all within the

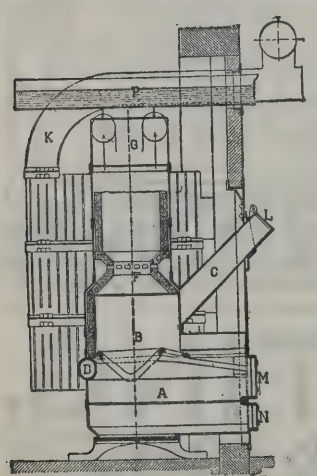
limits of the municipality. Forty-four years ago, when James Pagan wrote his "Sketch of the History of Glasgow," there were only four, of which one was an accommodation bridge.

The first bridge of which there is any tradition—it can scarcely be called a record, since it is only referred to incidentally in a charter of 1258, quoted by Dr. Macgeorge in his "Old Glasgow"—was a wooden one, which in the later years of the thirteenth century is believed to have spanned the river at or near the foot of what is now the Saltmarket. Cleland's "Annals" mention that Sir William Wallace, with three hundred horsemen, rode by night from Ayr, and "arrived in the morning at the Bridge of Glasgow, which at that time was constructed of timber." This, like other references of the sort, is vague, but there is no doubt that in 1345 was founded what was for centuries to be known distinctively as "Glasgow Bridge." As originally built, it was a stone viaduct, with eight arches some 12 feet in width, and it was constructed at the charge of Bishop Rae near the foot of what is now Stockwell Street. According to M'Ure, the Bishop built seven of the arches, and "the Lady Lochew" the other, being the third arch at the north end. It was this Bishop Rae who procured from the Apostolic See a dispensation for legalising the marriage between Robert II. and Elizabeth More, "notwithstanding of their affinity and consanguinity," in return for which friendly office Robert founded a chaplaincy in the Cathedral Church.

The good bishop's bridge (of which Macgeorge reproduces two excellent views) must have been substantial enough, though so narrow, as Pagan says, as to make two wheelbarrows tremble when they met, for it lasted until the year 1671, when the southernmost arch suddenly fell on one of the days of Glasgow Fair. Concerning this disaster M'Ure wrote (1736):—"There was much of the care by Providence observed with regard to the fall of the arch, for it was the seventh of July, the very day of Glasgow fair, and about twelve of the clock, and though hundreds, yea, I may venture to say thousands, had pass'd and repass'd, both of horse and foot, yet not one single person got the least harm, which was wonderful, all circumstances considered, and was such an instance of the kindness of Providence that ought not to be forgotten to latest posterity."

This fallen arch was "quickly rear'd up upon the charges of the community." One hundred years later, viz. in 1777, 10 feet was added to the breadth, and two of the arches on the north side were built up for the double purpose of narrowing the river-channel and protecting the adjacent property from floods. Less than fifty years later, in 1821, a further addition was made under Thomas Telford, who constructed side footpaths on iron framings, which extended the width of the bridge to 34 feet. The length was 415 feet.



M'Ure speaks of twenty stone bridges in existence in his time, "twelve whereof are within the city, and eight without its liberties," but this does not of course mean bridges across the Clyde. Indeed for more than four hundred years—that is to say, down to 1772, when the Broomielaw Bridge was opened—the old Glasgow Bridge of Bishop Rae was the only roadway between the north and south banks of the Clyde within the precincts of Glasgow. "It has rang under the hoofs of a Scottish king's charger, and been pressed by the bare feet of the Highland host; the Regent Murray with his infantry, and a strong auxiliary force of Glasgow burghers, crossed it to shatter the last hopes of Queen Mary at Langside. Cromwell and his troopers, if they did not use it, must have admired it, for stone bridges were at a premium in those days; the luckless James II., when Duke of York, was lodged and fêted sumptuously by Provost Bell within a stonethrow of it; and it was of no small service to his descendant, Charles Edward, and his foraging parties during the ten days he recruited in Glasgow previous to the fatal field of Culloden."

So summarises Pagan, and, continuing his retrospect, remarks:—"How many tales could it tell of the dignity of the princely churchmen of Glasgow, in days ere Archbishop Beaton fled with the relics, the records and the golden candlesticks, and how eloquent could it be on the thousands upon thousands sterling which have been received in doles and mites by the generations of beggars who thirled themselves on its pathway, with their blindness and age and deformities and loathsome sores and troops of orphan children lent at so much a day!"

This Stockwell or Glasgow Bridge might have lasted for other two hundred years, as far as masonry was concerned, but the deepening of the river by the Clyde Trustees imperilled the foundations of the piers, and about 1845 it was condemned by the engineers as unsafe. At all events, in that year an Act of Parliament was obtained for rebuilding it, and a wooden accommodation bridge was erected alongside the old structure at a cost of 3,149*l.* 5*s.* 6*d.* In January 1847 the Stockwell Bridge, the historic "Auld Brig o' Glasgow," was closed against vehicles by the erection of an iron railing across the carriageway, and before the end of 1850 it was completely pulled down.

Of the Auld Brig o' Glasgow it should be mentioned that it was not on a line with Stockwell Street, but at an angle, built with a view more to the convenience of the Bridgegate than of

the Stockwell traffic. Moreover, it was not on a level, but rose to the centre by a somewhat steep ascent. Senex, who contributed so many interesting items of the history of Glasgow to the *Herald* some sixty years ago, mentions in "Old Glasgow and its Environs" that, as a boy, he crossed the Auld Brig of Bishop Rae in 1778 at the time when it was being widened. He says that it was furnished with two recesses on the east side, in which foot-passengers could take shelter from skittish horses and from passing vehicles, there being no side-walks before it was widened.

Some doubt about the security of the bridge in 1765 caused the magistrates of Glasgow to issue an order closing it against heavy carts and waggons, although accommodating "gentlemen and others passing along the said bridge in coaches and chaises." This shut off the Rutherglen people from the city—as the Rutherglen Bridge was not built until 1776—unless they crossed by the ford alongside the bridge or by the Dalmarnock Ford higher up. The magistrates of Rutherglen, therefore, brought an action of damages against the magistrates of Glasgow for shutting up the bridge. They gained in the Outer House, and the magistrates of Glasgow, after reclaiming, withdrew their appeal and reopened the bridge. It was this action and the popular dissatisfaction it created, which, according to Senex, led to the decision to build an additional bridge at the foot of Jamaica Street.

Rutherglen Bridge, built in 1775–76, is said to have cost only 1,800*l.*, of which 1,000*l.* was contributed by the royal burgh.

To finish the story of the Stockwell Bridge, the curious will find a long and interesting account of the demolition of the old structure and a comparison between it and the new bridge given by Mr. James Pagan in "Glasgow Past and Present," reprinted from the *Herald* of 1850. We gather from this that the contract price for the new bridge, taken by Mr. York, then Deacon-Convener, was to be 36,000*l.*, with 1,000*l.* to Mr. Walker, the designer and engineer, and 250*l.* per annum during construction to a resident engineer. The bridge, still familiarly called the Stockwell, but officially the Victoria, actually cost about 40,000*l.* It is of grey granite, in five arches of from 70 to 80 feet each, is 450 feet long and 69 feet wide, and was opened to traffic in 1854.

The origin of the Broomielaw, or New Bridge, as it was long called, has just been stated. The foundation-stone was laid on September 29, 1768, by Lord Provost George Murdoch—George III.'s "handsome Scotchman." Cleland records that the ceremony was one of much Masonic solemnity, and that an imposing procession set forth for the site from the Saracen's Head Inn. The Lord Provost officiated as Acting Grand Master of the Western district, but Cleland states that as he had not received a regular Masonic appointment from the Grand Lodge, the Grand Master afterwards "threatened him with Masonic censure." What succeeded this awful threat the historian has not recorded, but it will be as well that the officiating personage at the proposed new bridge should keep the dreadful incident in remembrance. The arches of this first Jamaica Bridge were finished, according to Cleland, in 1771, and the first carriage passed over it on January 2, 1772. It was designed by William Mylne or Milne (the designer of old Blackfriars Bridge, London), had seven arches, was 500 feet long and 30 feet wide between the parapets.

With regard to this bridge, however, it would seem that Milne's was not the first roadway over the Clyde at this point. In some notes by Senex in the *Glasgow Herald* of November 14, 1853 (reprinted in "Glasgow Past and Present"), appears the following extract from the *Weekly Magazine* of 1771:—"May 24.—By a letter from Glasgow we are informed that ever since Thursday morning last they have had almost a continued heavy rain, which has swelled the Clyde to a greater degree than has been known these many years past. On Saturday the temporary bridge adjoining to the bridge now building was entirely carried off by the flood, and the timber and supports erected for building the great centre arch of the (stone) bridge have likewise been entirely swept away." From this it would appear that there was then a temporary wooden bridge across somewhere on the line of the present Broomielaw Bridge.

We have not come across any record of the cost of Milne's bridge, but large as the bridge was esteemed it soon proved inadequate for the growing traffic of the city, besides which it had objectionable gradients. It was scarcely more than fifty years old when the necessity for a better erection began to be discussed, and about 1831 or 1832 the Bridge Trustees employed Thomas Telford to design the very handsome structure which still remains, but which is about to be removed to make room for one still larger. Telford's bridge was built by John Gibb & Son, of Aberdeen, and is cased with Aberdeen granite. The foundations are 10 feet deeper than those of its predecessor, and it is also 60 feet longer. There are seven arches, and the width, 60 feet over the parapets, was the greatest of any bridge in the country at the time it was built. The foundation-stone was laid on September 3, 1833, by Lord Provost James Ewing

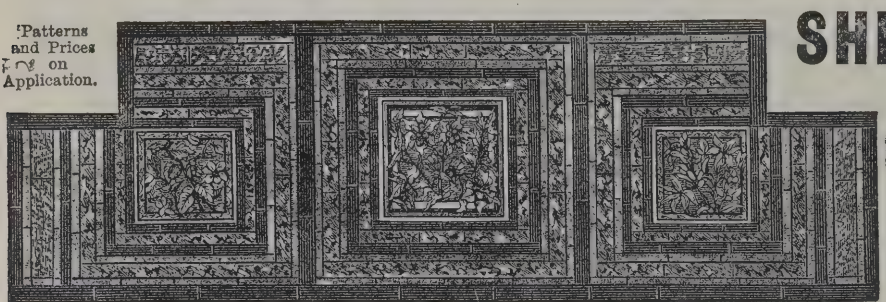
"with great Masonic pomp," and it is to be hoped he was more careful than his predecessor to see that his credentials were in order. It cost 34,000*l.*, and 4,000*l.* more was paid as compensation to owners and tenants of houses and lands, making a total somewhat less than the cost of the new Stockwell Bridge.

Some twenty years after the completion of Milne's Jamaica or Broomielaw Bridge the necessity was felt for a bridge east of the Stockwell Bridge, to connect the Saltmarket with Hutchesontown. To this scheme the patrons of Hutcheson's Hospital subscribed 2,000*l.*, and in 1794 the foundation-stone was laid by Lord Provost Gilbert Hamilton. In the course of the following year the work was so far advanced that the arches were completed and the parapets nearly finished when, on November 18, 1795, a tremendous spate, which flooded the whole of the lower part of the city, carried away the bridge bodily. This bridge was designed with five arches of a length of 406 feet (Cleland says 410), and a breadth of 26 feet within the parapets.



Concerning this unfortunate erection the following occurs in the history of Hutcheson's Hospital:—"The whole cost of the bridge was only 6,000*l.*, and there is too much reason to believe that the specification was altogether defective, and that no adequate structure could have been obtained for that sum. The contractor, however, a Mr. John Robertson, had given security for completing the work, and, according to the usual practice of that period, he undertook all risks and defects of the specification, of which he was presumed the most competent judge, and was bound to deliver a good and sufficient structure for the purpose required, and to uphold and maintain its stability for a limited number of years. The building had not been taken off his hands as complete when it fell during a flood nearly as great as that which occurred in the river in 1782. Mr. Robertson and his cautioners honourably fulfilled the engagement they had undertaken, and the Hospital received back all the advances which they, along with the Town Council, had made for the work."

The town thus lost nothing by the catastrophe, although one cannot but feel sorry for poor Robertson, who so "honourably fulfilled his engagements." The bed of the river was so "pooled" by the accident that it was deemed unwise to attempt a new stone bridge, so a wooden bridge, for foot passengers only, was thrown across at the foot of the Saltmarket in 1803. According to Cleland, this foot-bridge had eight supports and breakwaters, and cost 1,200*l.*, towards which, their records show, the patrons of the Hospital subscribed 200*l.* The annals of the Hospital record that this wooden affair was "from an elegant and much-admired design of Mr. Peter Nicholson, architect," but that before the year 1824 it became unsafe, "from the severe effects of the ice-floods and other causes." The records contain a long account of the negotiations, doubts and difficulties in planning for a new stone bridge, but at last, on August 18, 1829, the foundation-stone was laid of what was to be known as the Hutcheson's Bridge by Mr. Robert Dalglish, preceptor of the Hospital. It had five arches, was 406 feet long and 36 feet wide within the parapets. It was designed by Rennie, and was to have cost about 15,000*l.*, but the contractor failed during its construction and had to be assisted, so that the ultimate cost, including Parliamentary expenses and the making of approaches, &c., was about 31,000*l.* It was completed and opened in 1834, and a few years later it was "consolidated" in the Bridge Trust under which the Stockwell and Jamaica Bridges were being administered.

Eventful, however, as was the life of the Hutcheson Bridge, it was a short one. By the year 1868 it was deemed not only inadequate for the traffic but also insecure, and was closed to the public. Thereupon began the construction of that remarkably handsome structure now known as the Albert Bridge, which crosses the river in three splendid arches, one of 114 feet and the others of 108 feet each. It is 410 feet long and 60 feet wide. The foundations are of cast-iron cylinders filled with concrete, sunk deep in the bed of the river, and the piers and abutments are of red and white granite. This bridge was opened for traffic in 1871, and its entire cost, including approaches and street alterations, was 65,000*l.*, by far the largest amount as yet expended on any bridge in Glasgow.

We must now go back to Telford's (present) Broomielaw Bridge for the next development. While that handsome structure was in course of erection on the site of Milne's bridge, a wooden accommodation bridge was erected to the west of it on a line with Portland Street—on the very line, in short, which is now being discussed for an additional stone bridge. For some years after the new Broomielaw Bridge was completed, the wooden bridge at Portland Street remained in use, but about 1846 the timbers showed signs of decay, and it was taken down. The convenience of a bridge at this point was, nevertheless, too obvious to be neglected, and after an interval of a few years the present Suspension Bridge was constructed. It was opened in 1853, and altered and improved in 1870–71, but although elegant and useful enough in its way, it is only adapted

for passenger traffic. The original cost, according to Mr. James Pagan ("Glasgow Past and Present," from *The Herald* of November 1849) was to be between 6,000*l.* and 8,000*l.* That the estimates were exceeded may be concluded from the following note in the valuable introduction by the late Mr. John Carrick, city architect, to the volumes of Senex :—"It was not without difficulty that the present bridge was raised. Owing to insufficiency of estimates, and defects arising from bad materials and workmanship, the first towers had to be taken down and rebuilt, and for a long time grave doubts were entertained as to its stability. When the Bridge Trustees assumed the care of the city bridges, however, it underwent a thorough examination, was properly strengthened, and is now a satisfactory and substantial structure." The Suspension Bridge, it should be mentioned, was erected by the leading proprietors, principally on the south side, who took powers to levy a pontage, while supplying their own tenants with free pass-tickets.

The St. Andrews Suspension Bridge, between the Green and M'Neil Street, was erected in 1856 for the convenience of the people of the Bridgeton district going to and from their work. It is, of course, for foot passengers only.

Cleland's "Annals" make mention of "a free bridge" built across the Clyde in 1776 on the west end of Rutherglen. This is the present Rutherglen Bridge, which is therefore the oldest river bridge now within the area of Glasgow, although already doomed to demolition. It is said to be a fair copy of the Auld Brig o' Glasgow, with its five (instead of eight) arches and steep gradient, and it cost under 2,000*l.* About a mile and a half above this was the old wooden Dalmarnock Bridge, also connecting the east of Glasgow with the royal burgh, which was removed in 1888 to make way for the new iron bridge opened in the present year.

This, then, finishes our brief record of the history of the public bridges across the Clyde within the boundaries of the city. But besides these there are the gigantic and not wholly admirable structures belonging to the railway companies. The St. Enoch Bridge, massive though plain—not to say ugly—was opened in 1870. It has five river spans of 75 feet each, and two street spans of 65 feet each. It cost 38,000*l.* The Caledonian Railway Bridge, the most western of all the cross-river erections, was opened in 1879. It has three river spans and two street spans, the longest being 200 feet, and the entire length of the bridge 710 feet. It is impossible to say what has been the actual cost of this bridge, with the numerous alterations and enlargements of its approaches.

LONDON BOARD SCHOOLS.

THE action taken by the School Board for London against Mr. Johnson, builder, claiming damages for breach of contract, came before Mr. Justice Denman on Saturday. The contracts were :—(1) June 16, 1885, for the erection of a school in St. Andrew's Street, Wandsworth ; (2) June 23, 1885, for the erection of a school in St. Dunstan's Road, formerly called Biscay Road, Fulham ; and (3) January 2, 1885, for the erection of a schoolhouse in Eglinton Road, Plumstead. The plaintiffs allege that defendant was guilty of fraud, default and wilful deviation. The defendant denied the truth of such allegations, and when the case came on for trial before a jury in May last an order was made by consent of both sides that the following questions should be referred to Mr. H. A. Hunt, architect and surveyor, who was to report to his lordship, whose judgment was to be final. The following were the questions :—(1) Whether defendant was guilty of fraud in carrying out these contracts ; (2) whether the defendant was guilty of scamping the work with a view to his own interest ; (3) whether the defendant was guilty of wilful deviation from the contract in the sense of intentional and substantial departure from the contract with a view to his own interest ; (4) to what amount, if any, are the buildings the worse for the defects consequent on the defendant so being guilty of each of the three previously-named breaches, if any, and (if not necessary to replace) what the defendant has saved by such breaches ; (5) whether any or which of the aforesaid breaches were discovered within four years of the completion.

After hearing the arguments of counsel on both sides the following answers from the report of Mr. Hunt were read :—"(1) The defendant was not personally guilty of fraud, but to a small extent a plumber was guilty in laying light lead in the gutters to the amount of 7 cwt., of the value of 5*l.* 5*s.*; (2) the work 'generally' has been well done, notably the leadwork, the joiners' work, the plasterers' work, the brick and stone work, and although there are serious failures in the drainage work of at least one school, I do not consider that, as a whole, the work has been scamped ; (3) there have been substantial departures from the contract (*a*) with the full cognisance of, or to comply with the wishes or orders of, the clerks of the works, such as the laying of the secret gutters, the using of one nail instead of two, the omission of the *débris* under the tar-paving and the concrete under the drain-pipes ; these omissions have doubtless put money into the defendant's pocket, but should have been

adjusted by the measuring surveyors in the usual way; (*b*) there has been a departure in the width of the wall-gutter, although it is difficult to ascertain from the drawings what the width should be, and the specification does not explicitly state the minimum width of a wall-gutter; still I am of opinion that about 20 cwt. of lead has been saved in two of these schools, and 3 cwt. additional put into the third; (4) with the exception of the drainage, I do not consider it necessary to take up and restore any of the work, but I am of opinion that the defendant has saved by the above-mentioned breaches the sum of 240*l.*, and to make good defects which have manifested themselves the sum of 175*l.* should be allowed; (5) I am of opinion that the writ was issued within four years of the date that the clerks of the works certified that the schools were finished." The referee, in conclusion, remarked that the defects which had manifested themselves in the buildings could not have existed without the contributory negligence of the School Board and its agents.

His lordship reserved judgment.

THE CORPORATION AND THE WATER SUPPLY.

A SPECIAL meeting of the Court of Common Council was held at Guildhall on Monday, the 2nd inst., when a report of the County Purposes Committee on the subject of the water supply was discussed. The report recommended that the necessary steps should be taken to introduce a Bill in Parliament next session for the following purposes:—(1) To give statutory powers to the joint committee of the Corporation and the London County Council; (2) to authorise that joint committee to give notices to treat to the metropolitan water companies within four years and to make the giving of such notices obligatory at the expiry of that period; (3) to constitute a tribunal to ascertain the price to be paid, and to clothe such tribunal with the fullest powers of inquiring into and deciding upon all such questions as it may consider necessary with a view to purchase; (4) to enable such tribunal to decide as to the purchase by local authorities outside London of the works of distribution within their district, and also to decide as to the supply of water in bulk to such outside authorities; and (5) to pay for the undertakings by stock having the ultimate security of the county rate. These recommendations, especially as to the obligatory purchase of the existing companies and the absence of any provision for a supplementary supply, were warmly opposed at the last meeting.

A further report was presented at the meeting from the County Purposes Committee of the Corporation. They stated that they had received in conference a deputation of the London County Council. The deputation stated that they were unable to agree to the recommendations of the report as a whole, but they expressed their views in confirmation of the course mutually agreed upon and placed before the committee of the House of Commons on the Corporation's Bill of last session, adding their very earnest desire to continue their co-operation with the Corporation, and suggesting the reintroduction of the agreed Bill of last session. In these circumstances the committee resolved that, having heard the views of the deputation of the London County Council that the agreed Bill of last session should be reintroduced, the committee were prepared to recommend the adoption of that course. They therefore suggested that they should be authorised forthwith to take all necessary steps for the reintroduction of the Bill.

Mr. Deputy Rose-Innes, in moving the adoption of this report, said the Bill of last session was drawn up on a basis accepted by the Corporation and the County Council, and provided for the appointment of a statutory water committee of the two bodies, who should have power to promote Bills for a new supply of water or the purchase of the existing companies, or both, taking a limit of time if forced to do so. The costs of the Act and the administration of the committee and the promotion of the Bill would fall on the county rate. The supply of water in each district in the metropolitan water area outside the county of London would be as far as practicable in the hands of the local authority of each district, and within the county of London in the hands of the statutory committee, who would have full power over details, but questions of principle and policy would be reserved for the London County Council. The result of that fresh report would be the abandonment of the proposed four years' limit. He would undertake to lay the draft of the Bill on the table of the Court before it was submitted to Parliament, but meanwhile it was important that the necessary notices should be at once given. Replying to questions, Mr. Rose-Innes stated that the Bill proposed a commission to inquire fully into the conditions of the existing supply, and, in view of the purchase, to open up negotiations with the present companies and others, and also to prepare a scheme for a fresh supply if necessary. On the proposed water committee seven-eighths of the members should be appointed by the County Council and one-eighth by the Corporation. If the Bill passed, the expenses of its promotion

would come from the county rate; if it failed, the cost would be borne by the Corporation, as the County Council had no power to promote Bills.

Mr. H. Hicks said the Court was embarking on a course pregnant with peril to the finances of the Corporation. It would be much better if the Corporation, instead of embarking upon unlimited expense, confined its proceedings first to the City, and, if successful, they could be then extended to greater London. As an amendment to the adoption of the report he moved that the report should lie on the table, and that it be referred to the County Purposes Committee to give notice of the Corporation's opposition to any Water Bill or Bills that might be introduced into Parliament, in order that they might be amended in the interests of the ratepayers and water consumers, and that they be instructed to inquire and report forthwith upon the desirability of introducing a Bill in Parliament for the purpose of placing the water rates in the City on a juster and more equitable basis.

Major Joseph seconded the amendment.

Mr. Goldney, the Remembrancer, replying to questions, said that November 20 was the latest possible day for giving notice of the Bill. If the Bill was thrown out on the second reading, the expense of its promotion would be trifling—say 200*l.* or 300*l.*; but if it passed the second reading and was referred to a Select Committee, it would then encounter the opposition of the water companies, and the inquiry might be long; but as far as he could see the expenses of witnesses need not be great, as they could be confined to members and officers of the Corporation and the County Council.

In the discussion which ensued, Mr. Price said that at present it would require upwards of 40 millions to pay out the water companies. The Committee should therefore be careful how they proposed dealing in that respect. Mr. Deputy Bedford supported the amendment, and asked what chance existed of the Bill as proposed passing the ordeal of a Select Committee, looking to the manner in which it was dealt with last session.

The amendment of Mr. Hicks was negatived, and the adoption of the committee's last report was agreed to by a large majority.

At the meeting of the London County Council, the vice-chairman said :—I have the satisfaction of stating that after the communication between a deputation from the Water Committee and a deputation from the County Purposes Committee of the City, the City agreed entirely with our proposals. In other words, what they agreed to was that the Bill that we jointly introduce should be a Bill framed on the lines of the agreement between the City and the Council last summer, and of which the Council is already aware. And I will mention that there is no provision whatever for purchase by arbitration or for any other purchase compulsorily on this Council, or the City, or the proposed water committee. With regard to the application to the Government, I have also the satisfaction of stating that a reply has been received by the chairman from Lord Salisbury stating that the Government have the subject of the water-supply under their very serious consideration.

CHICAGO EXHIBITION NOTES.

THE Associated Press has applied to the Grounds and Buildings Committee for suitable space, either in the press quarters on the grounds or in a separate building, where its reports can be prepared and despatched during the Fair.

BETWEEN 340 and 350 men are employed in perfecting the landscape features of the exposition site. It is the intention to make the grounds exceedingly beautiful by walks, drives, lawns, terraces, fountains, shrubbery and flowers. Several hundred thousand dollars are to be expended for this purpose.

THE Palace of Music, it is now expected, will stand on the great island formed by the lagoons, and will be surrounded by a magnificent garden of flowers, 10 acres or more in extent. The structure will measure 150 by 250 feet, and cost approximately 100,000 dols.

THE magnitude of the building operations now going on at Jackson Park can be surmised from the fact that an average of from thirty-five to forty car-loads of construction material arrives daily. The buildings are rising with wonderful rapidity.

IVAN MALAKOFF, a St. Petersburg capitalist, wants to reproduce at the exposition a street scene from Nijni Novgorod. He agrees to spend 250,000 dols. upon the reproduction.

A COMPANY has applied for space to erect a building in the form of an iceberg, in which to make a Polar exhibit. A group of Esquimaux, with reindeer, furs and all the paraphernalia of inhabitants of the Polar regions, will be installed in the building if the concession is granted.

BRITISH COLUMBIA has decided to build a structure, which will be a novelty in architecture, composed of every variety of wood known to the British Columbia forests. The building will be built first in sections of contrasting woods neatly mortised together. The roof will be of native slate and a variety of cedar shingles, making in all a pleasing effect. It is intended to ship the building in sections, ready to be erected on its arrival. The display will be unique in every way, the government and cities of the province subscribing to the fund.

VAN HOUTEN & ZOON, the manufacturers of cocoa at Weesp, Holland, have set apart 100,000 dols. with which to make a splendid exhibit. They intend to erect a large building in the style of old Holland architecture of the fifteenth century, and to put in it, besides an exhibit in their own line of business, paintings, views, bric-à-brac, &c., illustrative of the Netherlands and the life and characteristics of the Dutch people.

A CONCESSION has been granted to M. Stepanni to erect a Moorish palace at the World's Fair. One of the many attractions which he proposes to exhibit in this palace is one million dollars in gold coin in one pile. It will be in a strong cage, and M. Stepanni says:—"Just under the gold will be constructed a fire and burglar-proof vault. To the doors of this vault will be connected electric wires. In the event of an attempt to rob the palace, my guards will press an electric button—the entire pile will fall into the vaults and the doors will spring shut."

A TOWER has at last been decided upon for the exhibition. The designs are by Mr. George S. Morison, and the contract has been let for 1,500,000 dols., subject to a heavy fine for delay in the completion of the work. The height is to be 1,000 feet, about the same as the Eiffel Tower, and there will be three platforms at various heights, the first being 250 feet in diameter and 200 feet from the ground. The foundations in this case will probably be carried down 40 feet.

NO confirmation has been received of rumours regarding the foundations of the immense exhibition buildings giving way. As to the substrata of Chicago, over the greater area there is a layer of good clay, 5 feet thick, about 10 feet below the surface level, and beyond that the material gets gradually softer until, at a depth of 40 feet, it is practically silt. But here the solid clay is again encountered. Several of the buildings in the city are of great height—up to nineteen storeys, or close

"SPHINX" PORTLAND CEMENT

112 lbs. per bushel. Slow setting; test 1,000 lbs. to 1¼ inch; seven days. Fineness, 2,500 meshes to square inch, with less than 10 per cent. residue. Over 10,000 tons supplied to Cardiff and Hereford Water Works.

Specially adapted for Concrete Floors and Street Paving.

"EGLIPSE" PORTLAND CEMENT

Quick setting; test, 3 parts. Standard Testing Sand, 280 lbs. per square inch; 28 days. The finest, most plastic, best sand carrying, and cheapest Cement in the market. Specially adapted for laying encaustic tiles, making joints in sanitary pipes, internal stucco, concrete foundations, &c.

upon 200 feet high—and it is found feasible to build the foundation on the clay; but the method adopted is to build up an underground structure with concrete and rails, which is weighty and yet occupies little room. It is often the case, too, that the foundation is weighted with rails equal in total weight to the buildings to be erected, so that the foundation settles before the structure is commenced.

AMERICAN NOTES.

THE twelfth annual meeting of the American Society of Mechanical Engineers will be held at the rooms of the Society, 12 West 31st Street, New York, commencing Monday evening, the 16th inst.

THE *Sanitary News*, Chicago, says:—No one likes to see a jerry plumber go to work. In the first place he will not do good work, and in the second he is doing the work he should have left for those who studied their trade and became efficient at it to do. There are men employing that kind of men, knowing full well that they do not do their work properly, and they do not want them to. The men who build houses to sell, put them up and speculate on them, may be found any time with a lot of these men under their employ.

A ST. LOUIS employer operating a zinc works was recently charged with importing workmen from England in violation of the Contract Labour Law. It was shown that an English workman had written to the manager of the zinc works asking for employment for himself and a companion. The manager replied stating that he had arranged for their transportation and directing the men where to apply in England. The men came as far as Philadelphia, where they were intercepted by the immigrant inspector and ordered back to England. The case was first tried before Judge Thayer, of the United States District Court, who decided that the correspondence did not constitute a contract within the meaning of the law, and that to prepay the transportation of an alien was not unlawful unless a regular contract was entered into under which the alien agreed to perform some kind of work, the terms of which both parties had agreed to. When an appeal was taken this decision was confirmed by the upper Court.

THE *American Manufacturer*, Pittsburgh, says:—Mr. S. L. Cohoon, of Battle Mountain, Nevada, has patented a device whereby waste steam can be utilised from a locomotive when stopping at a way station for the purpose of taking in wood, water or other purposes, the steam saved being used to pump water for the tanks or reservoirs about the station.

THE same journal says:—"The Middlesborough Town Company, at a recent meeting held in London, England, decided to push the development of Middlesborough, Ky., and raised 1,250,000 dols. for this purpose. These funds are said to be for the purpose of completing the South Boston Ironworks, waterworks, Davis charcoal furnace and other plants.

THE Union Pacific Railroad possesses a novelty in a compressed-air car-duster, for cleaning the inside of passenger-cars. In the sheds at Portland, Oregon, the passenger-car yard is laid with pipes in connection with the air-compressing plant. At intervals an ordinary garden-hose with a nozzle is attached to the pipes in a manner which will allow the nozzle to be drawn into a passenger-car through a window, where the air, at a pressure of 50 lbs., is used to blow the dust out of every possible lodging place, including the plush upholstery.

THE manufacturing establishments of Lima, O., have received notice from the Lima Gas Company that owing to the rapidly-decreasing supply the natural gas would be cut off this month.

IMITATIONS of wood are, the *N.-W. Lumberman* of Chicago says, all the go, especially in cheap furniture. It is like wearing cheap stones in lieu of diamonds. Those who cannot afford the costly woods are persuaded to buy rather inexpensive goods made to somewhat resemble the fancy woods by means of the counterfeiters' subtle arts. The high price of oak has caused a largely increased demand for elm to be used as an imitation. Imitations of mahogany, rosewood, walnut, &c., are time-honoured.

THE *Scientific American* says:—The members of the Technical Society of the Pacific Coast lately went to Palo Alto on the invitation of E. L. Ransome, who has nearly completed two large concrete buildings for the Leland Stanford, Jr., University. One of these is the girls' dormitory. The larger one is the museum building, and is the finest piece of building concrete work yet done in this vicinity. The structure is absolutely fireproof, and intended also to be earthquake-proof. It is built on the system patented by Mr. Ransome, so as to be a homogeneous structure as to walls and partitions, there being no joints. Twisted iron rods are used for additional strength where necessary. Even the interior arches and ceilings are of concrete. The stairways are made of concrete, and these will

be covered with marble steps. The hallways will be finished in marble over the concrete. There is no wood anywhere in the building, the window-frames, &c., being of metal. The exterior is furnished with a smooth coat of cement to resemble brownstone. The heavy columns of the entrances are, like the main structure, of concrete, and the statuary to surmount the building is moulded of the same material.

In connection with the Nicaraguan Canal, Mr. Warner Miller says :—"I have been spending some time in investigating the great canals of Europe. I went to see the great Manchester Canal. I then went to Holland, and saw the great Amsterdam Canal, which makes that city a seaport. The most important canal in all Europe is now being built by the German Government. It runs from Kiel, the great German naval station on the Baltic Sea, sixty-three miles across the Holstein peninsula, and ends at the mouth of the Elbe. It is to be a ship canal, and will save a distance in sea travel, when completed, of 700 miles. It will give direct communication between the North and Baltic Seas. The cost of this canal will be 50,000,000 dols., and the work on it is about half completed. There are about 10,000 men employed upon it. If the German Government can afford to spend 50,000,000 dols. to save 700 miles, the people of the United States can afford to build a canal across Nicaragua and save 10,000 miles between New York and San Francisco.

TRADE NOTES.

Mr. John Grundy's patent warm air ventilating grates are being erected at Belvoir Castle, the seat of His Grace the Duke of Rutland.

We have been requested to announce that the "Rosher system" of heating water has been adopted to warm the water in the canals of "Modern Venice" at Olympia. The volume of water is about 500,000 gallons, and its area nearly 1½ acres. This system of heating has been adopted by the Rainbow Engineering Company, of Victoria Street, Westminster, S.W., and has been extensively used by them for various swimming-baths throughout the country.

The extension to the Devon County Asylum, Exminster, is being warmed and ventilated throughout by means of Shorland's patent Manchester grates, which have proved satisfactory in the old building, the same being supplied by Mr. E. H. Shorland, of Manchester.

The new gasholder which has been erected at Johnstone, N.B., has been formally opened. The burgh officials consulted Mr. James M'Gilchrist, gas manager, Dumbarton, and on his advice the erection of a gasholder to augment the supply by 125,000 cubic feet was resolved upon. The Barrowfield Iron Company erected the gasometer on the telescopic principle, in order that, if necessary, it may be doubled for a small expenditure. Messrs. Black & Eadie, Paisley, contractors, constructed the tank, which is of brick and puddle. Mr. M'Bride, Paisley, was clerk of works.

The ventilation of the new higher grade school, Cardiff, is being carried out by Messrs. Baird, Thompson & Co., ventilating engineers, London and Glasgow, their latest improved patent ventilators being adopted throughout the whole building. The vitiated or foul air is extracted by means of their improved "Æolus" invisible automatic exhaust-roof ventilators. This concealed roof-ventilator provides for the extraction of vitiated air from churches, schools and other buildings, without disfiguring the edifice by the erection of excrescences on the roof. The introduction of pure, fresh air is provided by means of their latest improved air-inlet panel-ventilator.

At the monthly meeting of the Wallasey Local Board it was reported that Mr. Peter Smith had withdrawn his tender for widening the existing promenade to the north of Egremont Ferry for 600*l.* 19*s.* The tender of Messrs. W. H. Bleakley & Co., the next lowest, was therefore accepted.

Alterations have been made to the public hall, Brampton, the whole of the interior of which has been remodelled, so as to give increased accommodation, and the most careful attention has been paid to the ventilation, which has been carried out on the recommendation of the "Climax" Ventilating Company, 15 Great George Street, Westminster, S.W.

The well-known business of Mr. James Hill, Queen Victoria Street, has just attained its majority, and the event was celebrated by a dinner at the Holborn Restaurant on Monday, November 9th. Mr. Hill occupied the chair, and there was a large gathering of employés and friends. A very pleasant evening was spent, the usual toasts being interspersed with songs, musical sketches, &c. The principal toast was "Success to the Firm," and this was suitably responded to by Mr. Hill and his two junior partners, Mr. How and Mr. King.

At Nuneaton an inquiry has been held by Mr. Taylor, Local Government Board inspector, into an application by the Local Board to borrow 5,700*l.* for various improvements. 2,600*l.* of

this sum is required for a compound condensing-engine, capable of raising 60,000 gallons of sewage per hour, with an engine-house, a well with a sewer from the bottom to the existing pump well, and a foreman's cottage; 1,500*l.* was for the extension of Manor Court Road; and 1,600*l.* for the purchase of land for the erection of a fire-engine station, with suitable offices, houses for the caretaker and the engine and the road foreman, and shedding for carts and stores.

BUILDING AND BUILDERS.

NEW Branch Stores for the Queensbury Industrial Society have just been opened at Thornton, Bradford. They consist of stores for grocery, drapery and flour, with warehousing and agent's house attached, and have been erected from designs prepared by Mr. Herbert Hodgson, A.R.I.B.A., of Bradford, by local contractors, at a cost of about 1,000*l.*

THE tender of Mr. Colin Macandrew, builder, for the extension of the Edinburgh Post Office has been accepted by the Commissioners of Her Majesty's Board of Works.

THE work of excavating for the proposed lift from the Lower to the Higher Town at Bridgnorth has been begun by Mr. G. Law, contractor, Kidderminster.

THE Dundee Harbour Trustees, in considering the new Bill which they intend to promote in the ensuing session of Parliament, agreed to ask for power to construct a new jetty to promote the fishing trade of the port, and to extend and improve the accommodation connected with the foreign cattle trade.

AT Cardiff an inquiry was held by Mr. Joseph Smith. The Corporation apply for leave to borrow 25,000*l.* for providing an infectious diseases hospital, 21,450*l.* for the extension of the Town Hall and Municipal Buildings, 3,170*l.* for the formation of a new street, and 2,500*l.* for works of sewerage.

THE Blackpool Town Council have decided to promote an Improvement Bill in Parliament to obtain powers to widen the promenade about twenty yards along its entire length; also to purchase land and buildings to erect a new town hall thereon; to reconstruct the lower walk, which has been latterly washed away, and to improve Claremont Park generally.

A GREAT Lancashire county bazaar has been opened at the Public Hall, Preston, in aid of the fund for the erection of a Poor Law certified Roman Catholic school for Lancashire. Land has been purchased outside Preston at a cost of 4,500*l.* A second school is being established outside Liverpool, and both institutions involve a heavy cost.

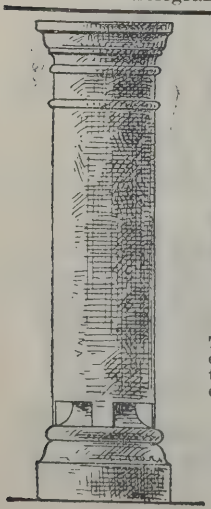
VARIETIES.

THE Rugeley Local Board have appointed Mr. W. H. Radford, C.E., of Nottingham, as their engineer to prepare plans for, and to carry out, a scheme for the water supply of the district. It is proposed to bore into the Bunter sandstone on the hills above the town, and store the water in a covered reservoir, from which it will be supplied by gravitation. No pumping will be required.

THE sanction of the Local Government Board has just been obtained to a loan for carrying out the sewage scheme, Hucknall Torkard. The system adopted is that known as the "International process," which has been applied with great success in various towns throughout the country. In addition to the precipitation tanks and filter-beds, 8 acres of land have been obtained on lease from the Duke of Portland, over which, if found necessary, the sewage may be conducted. The purified effluent will find its way into the river Leen. The Local Board will obtain tenders for the carrying out of the works forthwith, the engineer being Mr. Herbert Walker, Assoc.M.Inst.C.E., of Newcastle Chambers, Nottingham.

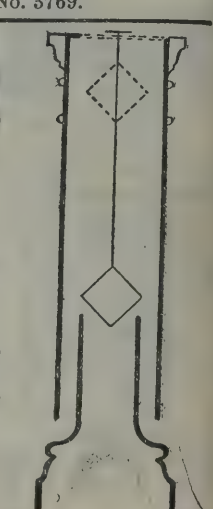
THE *Indian Engineer* says Mr. Cousins, of 14 Bridge Street, Westminster, is the expert who is to report on the sanitation of Madras during the ensuing cold weather. He is to be paid 3,500*l.* for his six weeks' work.

THE Pier and Harbour Commissioners, Stornoway, propose to carry out an extensive scheme for the harbour improvement.



PLANS have been prepared for the construction of a harbour of refuge at Craster, N.B., by Mr. Sanderson, engineer.

IT is stated that Messrs. Scott & Co., shipowners, Greenock, have been compelled to refuse to contract for a line of battleship for which they had been asked to offer, because of the James Watt Dock, the largest in Greenock, being six inches narrower than the required size of the ship.



IN consequence of the success of the Exhibition of Antique Carpets held in Vienna some months ago, the Austrian Government have decided to publish a permanent record of the collection, and for this purpose 150 typical examples have been selected. Monographs will be contributed by the leading European experts, and Mr. C. Purdon Clarke, C.I.E., keeper of

THE
"CLIMAX" VENTILATING CO.'S
DIRECT ACTING
CHIMNEY COWL,
For the Preventing a Blow-down.
This Cowl is specially designed for preventing a blow-down and assisting the up-draught. It is admittedly the most efficient in the market. Its construction is scientifically and mathematically correct, and no matter from what direction the wind strikes it, a powerful upward current is established. It is noiseless, has no movable parts to get out of order, is easily cleaned, the cone over inner shaft being made to push up. It has THE very decided advantage over every other Cowl, IT IS SIGHTLY.
PRICES AND PARTICULARS ON APPLICATION.
THE "CLIMAX" VENTILATING CO.,
15 GREAT GEORGE STREET WESTMINSTER, S.W.

the South Kensington Art Collections, has been invited to write the general summary of this important work. Mr. Clarke, who has enjoyed the advantage of having studied the subject at the places where these gems of textile art were anciently produced—in Spain, Turkey, Syria, Persia and India—will also edit and translate the English edition, the plates of which are to be printed on white satin.

THE Improvement Committee of the Oldbury Local Board report that they have considered the schemes and plans submitted by three engineers for dealing with the sewage at the farm, and decided to recommend the Board to accept the plans and schemes marked "Forward"; that the plans marked "A 1, A 2 and A 3" be given the second prize, and those marked "Practical" the third prize.

THE Worcestershire City Council have authorised the committee to publish advertisements inviting persons or companies for the construction of electric-lighting works to submit plans, detailed descriptions and estimates of the cost for constructing the works they think necessary for enabling the Council to supply electricity equivalent to 12,000 ten-candle-power lamps, to be hung in a district extending northwards as far as McNaught & Co.'s Works, eastwards as far as Shrub Hill Station, southwards as far as the canal, and westwards to the Severn.

AN inquiry has been held by the Local Government Board of Maidstone relative to applications made for sanction to borrow 6,700*l.* for the purchase of the Lock-meadow land and 2,554*l.* for works of improvement.

IT is proposed to construct a bridge near Hayling Island Ferry, Portsea, at an estimated cost of 20,000*l.*

A FUND is being raised for providing fittings for the chancel of Denstone College Chapel, a work which is being proceeded with in sections, the latest completed portion being the choir-stalls of carved oak.

THE death is announced at Ealing of Mr. Thornhill Harrison, so well known as inspector under the Local Government Board. Mr. Harrison was born at Thornhill, Durham, in 1815. Educated at Edinburgh University, he was afterwards articled to his brother, Mr. T. E. Harrison, for many years associated with the North-Eastern Railway as chief engineer. After serving his apprenticeship, Mr. Thornhill Harrison was engaged under Mr. Brunel in the construction of the Great Western and South Devon Railways. In 1865 he was appointed a member of the Royal Commission on the Pollution of Rivers, and retained that position for four or five years. Subsequently he was appointed one of the engineering inspectors under the Local Government Board.

PROTECTION FOR IRON.

A NEW process by which iron or steel may be covered effectually and permanently with a coating of pure lead has lately been introduced and is now in operation at the works of Messrs. Joseph Westwood & Co., at Napier Yard, Millwall. This process is an American invention patented in the United Kingdom and on the Continent. The three patents are owned by a syndicate, under whose auspices the experiments have been made. They do not propose to work the patents themselves, but to grant licenses to the different galvanising firms and other cognate industries. This method of protecting iron from corrosion opens up a wide field of application on account of its reduced cost and greater durability as compared with ordinary galvanising, and by its being less readily affected by acids. During the past six months numerous mechanical tests have been made to ascertain the effect of this process on the tensile strength of the iron, with the result that while iron galvanised is deteriorated and loses some part of its original strength, the iron coated by this method retains its tenacity and preserves at the same time its ductility, and so closely are the two metals allied that the lead is not removed from the elongated and contracted fibres, even at the point of fracture. Netting and wire-gauze of fine mesh can be coated satisfactorily, and sheets, bars, wire, &c., can be treated equally well either before or after they have been subjected to the ordinary workshop manipulations. For bolts, rivets, wood screws, &c., the process is peculiarly adapted, as the threads do not become filled up by immersion in the molten lead, and in consequence no cleaning out or retapping is necessary.

THE CARDIFF CUP.

THE cup presented by the Marquis of Bute to the Corporation of Cardiff, as a memorial of his lordship's mayoralty, was designed by Mr. Birnie Rhind, the sculptor, who adopted the Italian Renaissance as the most appropriate style for a vessel which is 30 inches in height. On a circular base, which is richly jewelled and engraved, are seated round the stem of the

cup three river gods, representing the three rivers of Wales, each of the figures bearing vessels from which water is running, indicative of their symbolical character, the running water being symbolised in rock crystal. Round the stem alone is twisted and entwined the Welsh dragon, the body being elaborately studded with carbuncles, the eyes of emeralds and the claws of diamonds. Above are two highly-decorative handles, the upper part of the handle being a female winged figure, and the lower part dividing into scrolls, which attach themselves to the bowl of the cup. On each side of the cup between the handles are shields—that on one side bearing the Marquis of Bute's arms, the quarterings being shown in coloured enamel, and that on the other side bearing the arms of Cardiff, surmounted by the mural or civic crown. Between these shields, behind the handles, are decorative masks, the remaining spaces being enriched by *repoussé* ornament. On the centre of the lid stands a female figure symbolical of Cardiff. Her left hand rests on a rudder, to denote the shipping industry of the city; while her right foot, slightly advanced, rests upon a piece of coal, another important branch of Cardiff's prosperity. In her right hand she bears the olive branch of peace. The mural crown on her head is composed of diamonds. At her feet reclines a water nymph, representing the Severn; while around the lid are water lilies and leaves, indicating the river flowing past Cardiff, each leaf having a diamond sparkling in the centre. The figures are enamelled a natural flesh colour where not hidden by the drapery. The work was carried out by Messrs. Crichton & Co., of Edinburgh. The cup cost about 2,000*l*.

REGISTRATION OF PLUMBERS.

THE Mayor of Limerick presided at a special meeting, held in the offices of the Limerick branch of the National Registration of Plumbers, to consider a Bill drawn up by the Worshipful Company of Plumbers, London, to legalise the registration system. The Mayor was supported by the City High Sheriff, Dr. Barry, corporation medical officer of health, R. Fogerty, C.E., H. Sexton, J. Shiels, J. Palmer, &c. The hon. secretary to the local committee, Mr. P. J. Lynch, C.E., read the draft Bill to the meeting, and explained that in principle it aimed at giving legal sanction to the work which had been already done, and transferring to one General Council the powers and control already exercised by the various district councils and the Worshipful Company of Plumbers. Limerick was one of the cities in Ireland scheduled to elect representatives on the contemplated General Council.

After full discussion, Dr. Barry moved the following resolution:—"That this meeting of the committee for Limerick and district hereby approve of the principle of the Bill drawn up by the Worshipful Company of Plumbers, London, to define and legalise the system for the National Registration of Plumbers."

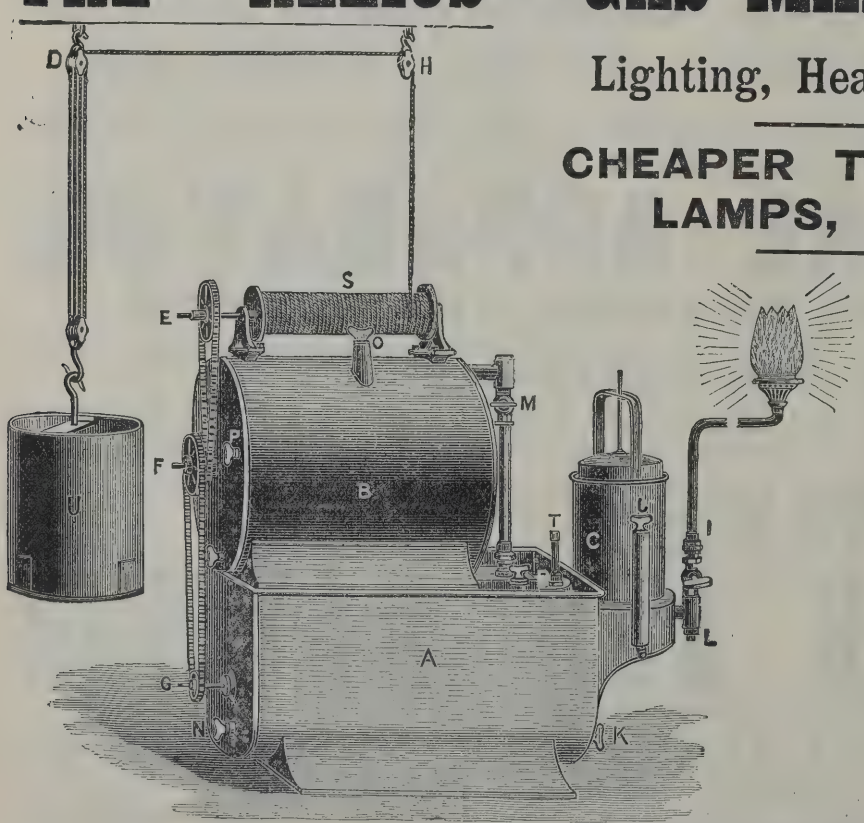
The resolution was supported by Mr. Fogerty and carried.

The High Sheriff being moved to the second chair, a cordial vote of thanks was passed to the Mayor for his kindness in presiding.

The Mayor, in reply, said that he was particularly happy in assisting a movement so closely connected with the public health.

AT the last meeting of the Belfast Master Plumbers' Association resolutions were unanimously passed approving of the action of the Worshipful Company of Plumbers, London, in drafting a Bill for legalising the national system for the registration of plumbers, and recommending the inclusion of a representative of the Association on the General Council contemplated by the draft Bill. At the same meeting a resolution was unanimously passed urging that the powers conferred on the Belfast City Council should be made use of to sustain and develop the Belfast Technical School, and recommending that "all encouragement on the part of masters be given to their apprentices to secure their attendance at the plumbing classes in the Technical School."

THE INSTITUTION OF CIVIL ENGINEERS.



THE opening meeting of the 74th session of this institution was held on the 10th inst., and was very fully attended.

The following is a detailed list of the awards made for original communications submitted during the past session and discussed at the ordinary meetings:—Telford medals and Telford premiums to Llewelyn Birchall Atkinson and Claude William Atkinson, Assoc.MM.Inst.C.E., for their joint paper on "Electric Mining Machinery." A Telford medal and a Telford premium to Rookes Evelyn Bell Crompton, M.Inst.C.E., for his paper on "The Cost of the Generation and Distribution of Electrical Energy." A Telford premium to Frederick Ewart Robertson, M.Inst.C.E., for his account of "The Lansdown

THE "HELIOS" GAS-MAKING MACHINE

FOR

Lighting, Heating, and Motive Power.

CHEAPER THAN COAL GAS, OIL LAMPS, OR ELECTRICITY.

This Machine is the latest development of the Oil Gas systems. In most other such machines Gasoline is the gas-producing material, and as this can only be procured in large quantities, and is dangerous to store, there is naturally a great objection to its employment. The "Helios" Gas Machine is charged with Benzoline, which can be procured anywhere in large or small quantities. The Machine is simple, and the light produced far superior to coal gas. Machines made to supply from 6 to 2,000 lights.

Prices from £10 10s.

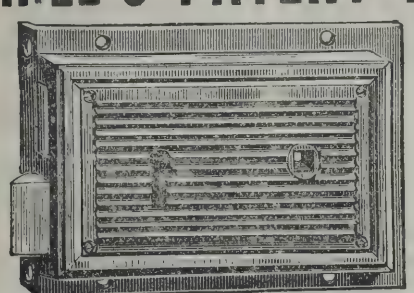
UNEQUALLED FOR

COUNTRY HOUSES, FACTORIES, HOTELS, &c.

FOR FURTHER PARTICULARS APPLY TO

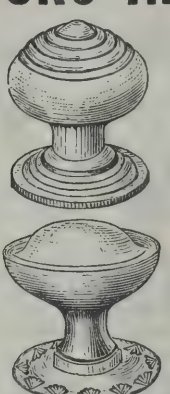
THE INCANDESCENT GAS LIGHT CO., LIM.

14 PALMER STREET, WESTMINSTER, LONDON.

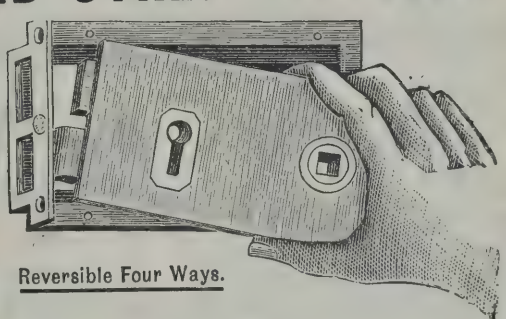


Bridge over the Indus at Sukkur"; to Edward Waller Stoney, M.E., M.Inst.C.E., for his description of "The New Chittravati Bridge, Madras Railway"; to Professor John Milne, F.R.S., and John M'Donald, for their joint paper "On the Vibratory Movements of Locomotives, and on Timing Trains and Testing Railway Tracks"; to William Langdon for his paper on "Railway Train Lighting"; to William Thomas Henney Carrington, M.Inst.C.E., for his paper on "The Reception and Storage of Refined Petroleum in Bulk."

For papers printed in the proceedings without being discussed:—A Telford premium to Bryan Donkin, jun., M.Inst.C.E., for his paper on "Thermometers in and about the Cylinder-walls of Steam-engines, with some Experiments on the Temperature of the Metal under Different Conditions"; to John James Webster, M.Inst.C.E., for his paper on "Fireproof Construction"; to Charles Preller Sheibner, Ph.D., Assoc. M.Inst.C.E., for his account of the "Carrara Marble District Railway."



For papers read at the supplemental meetings of students:—Miller prizes to Edmund Lewin Hill, Stud.Inst.C.E., for his paper on "The Counterbalancing of Locomotive Engines"; to John Henry Barker, Stud.Inst.C.E., for his paper on "The Design of Locomotive Cylinders"; to William Archer Porter Tait, B.Sc., Stud.Inst.C.E., for his account of "The Lanarkshire and Ayrshire Railways"; to Bertram Chatterton, Stud.Inst.C.E., for his paper on "Disintegrators"; to John Walter Brown, Stud.Inst.C.E., for his account of the "Malta Dockyard Caisson, No. 4"; to Auriol Sealy-Allin, Stud.Inst.C.E., for his description of "A New Type of Water-motor"; to William Herbert Wheeler, B.A., Stud.Inst.C.E., for his paper on "The Cleaning and Deepening of Rivers and Canals by means of the Transporting Power of Water."



Mr. George Berkley, the president, occupied the chair for the first time since his election, and delivered an inaugural address. He stated that his object would be to trace the advance of engineering work in relation to social progress. First of all he dealt with the efforts of men in utilising the resources of nature during prehistoric times, indicating what had been accomplished in this respect by the Egyptians, the Greeks and the Romans. The chief characteristics of more recent times as affecting engineering work were the development of commerce and the demand for more perfect sanitary conditions. Confining his remarks to the metropolis, Mr. Berkley pointed out that the death-rate had decreased from a mean of 24·8 per 1,000 during the decade ending 1850 to 22·5 in that ending in 1880, and to 21·4 in the year 1882, while during the past eight years it had averaged 19·52 per 1,000. This continuous reduction might fairly be attributed in a great measure to engineering work. The decrease in the death-rate might probably be much larger if the repair or the replacement of defective drainage and imperfect ventilation in old houses could be insured. A copious and constant supply of pure water at high pressure, being of primary importance for health and comfort, should receive early attention on behalf of the inhabitants of the metropolis. Attention was directed to the invention of type-printing and its influence on civilisation, to the successive developments of the steam-engine and to investigations for the more accurate and minute subdivision of time. To the marine chronometer of John Harrison might without doubt be attributed in some degree better navigation, by which the increase in the number of ships engaged in commerce in the eighteenth and nineteenth centuries had been rendered possible. The progress in shipbuilding was then referred to, and the successive steps by which higher speed and greater economy in the propelling machinery were introduced. These improvements had facilitated the building and navigation of the large steamers which now crossed the Atlantic in less than 6 days instead of about 14½ days as in 1840. The great increase in the number and in the size of ships had directed attention to the construction of suitable harbours and of lighthouses, of which several illustrations were given. Inland navigation of canals, including ship canals, next received attention, and in regard to the Suez Canal, opened in 1869, it was stated that in 1888 the average time occupied in passing through the canal by vessels not using electric light was nearly 38 hours, while vessels which used the electric light passed through in 22½ hours, thus saving 40 per cent. of time, and increasing the carrying capacity of the canal. In 1890, 3,389 vessels, of which 2,522 were English, passed through the canal, and 2,832 at night with the aid of electric light. The average length of the passage was 24 hours, or without stoppages 18 hours, representing a saving of more than 2½ hours since 1889. In this section of the address reference was made to the Manchester Ship Canal, although not yet finished, and details were given of some of the more important works. Canada and the United States had presented great opportunities for the engineer in the deepening of rivers and in the formation of canals, of which particulars were furnished. The idea of establishing a waterway across the American isthmus was then referred to, and attention was directed to the route proposed to be taken by the Nicaragua

Canal, between Greytown on the Atlantic and Brito on the Pacific. The Ship Railway now being constructed to connect the Bay of Fundy with the Gulf of St. Lawrence was next dwelt upon. The railways of India conformed generally to the type of British railways, except perhaps in regard to the sleepers, for, although timber was abundant in India, it was not durable for the purpose indicated. Accordingly for many years cast-iron and steel sleepers had been adopted. On the Great Indian Peninsular Railway there were 2,600,000 pairs of cast-iron sleepers, as compared with 848,000 wooden sleepers. The average life of iron sleepers during 18 years seemed to prove that they would last 60 years, or six times longer than wooden sleepers, and that their use (although their first cost was greater) would prove economical. From the administration report on the railways of India for 1890-91, it appeared that 10,900 miles on the standard gauge of 5 feet 6 inches were either made or had been sanctioned, and that there were nearly 7,500 miles of mètre gauge. The most noticeable feature on railways in all countries had been the necessity for greatly increasing the strength of bridges and other works of art, and especially the permanent way, in consequence of the greater weight of engines and rolling stock. The question of gauge elicited the opinion that this should be well considered for every country in the first instance, as only for the most important reasons should a second gauge be adopted, and then only as feeders to the main lines. Thirty years ago it had been thought that the works on Indian railways were too substantial, and that the system previously in vogue in the United States should have been followed. He, however, was of opinion that it was fortunate this suggestion had not been acted upon, for soon afterwards the temporary character of the American works had become apparent, and a more substantial system of construction was resorted to. Some of the bridges constructed in the United States then came under review, the most important, both on account of magnitude and of typical character, being the St. Louis bridge over the Mississippi, the Brooklyn suspension, Washington over the Harlem river at New York, and the cantilever railway structure at Niagara. Here reference was made to the proposed utilisation of the water power from the Niagara Falls, for which a company had been formed in 1886 and a charter had been secured. The progress in telegraphy, telephony, electric lighting and the electric transmission of power was next dealt with, and the experience acquired by the authorities of the General Post Office was cited. It appeared that by the multiplex system of working six messages could be sent along a single wire instantaneously in each direction. The length of conducting wires laid in England for public telegraphic purposes was 174,633 miles, and the number of instruments was 13,740. In London 5¾ million messages, and in Great Britain 66½ million messages were received in 1890. Speech had been maintained with perfect clearness by telephone between London and Paris, a distance of 311 miles. The production of electromotive force was then noticed, especially the transformation of electric into mechanical energy, by making the dynamo serve as a power-receiving as well as a power-giving machine. Since 1883 the usefulness of the dynamo and motor had been further developed, chiefly by the means taken to reduce losses of energy by friction and by eddy-currents and magnetic leakage, as well as to avoid sparking. For the illumination of streets in this country electric light might hereafter become more general. The length of electric rail or tramways worked in England only extended to 26½ miles, its most perfect application being, perhaps, that of the City and South London Railway. Another use of electricity was the connection of many parts of the world by submarine cables, of which 48,600 miles had been laid. Electricity had been successfully applied to lighting, haulage, drilling and coal-cutting in mines, both in England and America, and for welding metals—a process which was steadily on the increase.

A LINLITHGOW BUILDING DISPUTE.

AN action has been commenced in the Court of Session, Edinburgh, against the Town Council of Linlithgow by Mr. Richard Philip, a local builder. The circumstances are as follows. Mr. Philip was contractor for the erection of the new Town Hall. While the work was being proceeded with in 1888 part of the building subsided, and buttresses were erected with a view to strengthening the injured parts. A dispute has arisen as to who was responsible for the subsidence, and in consequence the Council refuse to pay the contractor the balance of his account for extra work. The contractor maintains that he worked according to the instructions of the architect and master of works, and that the subsidence was not caused by any fault on his part, but by the treacherous foundation on which the hall was built. The services of skilled men were called in, and reports submitted to the Council, but notwithstanding this, no satisfactory solution of the matter was arrived at. The Council maintain that the contractor is bound by a formal agreement,

MAW & CO, LIMITED, will forward on application Pattern Books or Special Designs, with Estimates for all kinds of Floor and Wall Tiling. Patterns can also be seen and particulars obtained at the Show-rooms of their appointed London Agents, Messrs. W. B. SIMPSON & SONS, 100 St. Martin's Lane, W.C.

entered into with the Council, to submit the matter to arbitration for final settlement. The dispute has gone on for a considerable time, and the contractor has now raised an action in the Court of Session to recover his money, the sum sued for being 283*l.* 17*s.* 10*d.* By a majority of eight to five the Council resolved not to defend the action, and a committee was appointed to meet Mr. Philip to arrange terms of settlement. Against this resolution the minority protested, and the Provost intimated that he would take means to prevent the money being paid over until the dispute had been referred to arbitration.

PROTECTION OF RESIDENCES.*

THE air we breathe, and which for this reason constitutes part of our body, is never pure. In the midst of cities it is full of dust, smoke and a score of minor impurities. In the open country it generally becomes purer with the distance from densely-populated spots, and the purest air is found on the summit of mountains and in remote woodlands. Pure air, this loose compound of oxygen and hydrogen, is constantly impregnated not merely with extraneous substances above referred to, but also with traces of all elements and natural compounds in proportion to their relative volatility. Accordingly, we find in it carbonic acid in measurable quantities, ammonia, nitrous acid, and even some metallic acids in traces. Arsenious acids, for instance, are always present in the vicinity of arsenious products, so that miners and workmen especially are injured by inhaling the air thus contaminated. A similar fate, as we know, is in store for workmen in the quicksilver mines and in the manufactories of white lead. Various odours will penetrate the air in immeasurably small quantities. It is altogether impossible to measure by weight or otherwise the substances which signify their presence by odours, though ever so penetrating, such as, for instance, assafœtida or musk. With every draught of air, therefore, we not only take in all substances therein suspended which are perceptible to our senses or by our instruments, but also take in immeasurably small quantities of all other elements and compounds in existence. Hence the mysterious compound of our blood so wonderfully complex. But the air is not merely a composite of all inorganic substances. The dust therein suspended is full of organic life—life struggling for existence, were it at the expense of the life of higher beings.

The whole philosophy of medical science has of late been subverted through the gradual discovery of the extensive species of minute beings called bacteria, the lowest order of beings known to exist. They were at once believed to be the product of a *generatio æquivoca*, of spontaneous generation, until it was made evident by Pasteur that they are generated *ex ovo*, from the egg. Philosophers have, however, then subsequently, not abandoned faith in spontaneous generation from the original elements upwards, but have put the bacteria up as a rather composite race of beings, made up from many millions of molecules, and established a belief in a class of organic beings as progenitors, as it were, of the bacteria, which beings are to be many times simpler in their compostion and smaller than are the latter, and so minute in size that they will for ever be hidden from human sight.

The microscope, so wonderfully improved in these days, has been instrumental in the discovery of many species of the bacteria family, to which special names were given, as though they were positively distinct from each other. The latest science, however, seems to discover that the family has but really one or a limited number of species, the members of which are changing from one form into another, an opinion which was early propagated by Professor Naegeli at Munich, but contradicted by other philosophers.

All diseases and ailments of the human system are, according to an overwhelmingly large number of medical philosophers, owing to encroachments thereon by bacteria, as destroyers of blood and tissues. Quite a number of these bacteria have been minutely measured. The modern microscope has given the diameter of a microbe, so called, at 1-20,000 of an inch, and its length at ten times that. Accordingly, a cubic inch of space would contain 800,000 millions of them, while the size of the average blood-corpuscle, at 1-3,500 inch in diameter by twice this for its length, would yield 20,000 millions of them, and that of a grain of san-dust, of an average diameter of 1-1,000 of an inch, 1,000 millions thereof to the cubic inch. Taking this size of the san-dust as a unit, the size of a blood-corpuscle is to be expressed by 1-20, and that of our microbe at 1-800 of such unit; and the microbe assumed is by no means one of the smallest. It is merely one of those which have been measured, while hundreds of them, perhaps ten to fifty times inferior in size, have not been accurately noticed under the spectra of a microscope. No scientist, as yet, has distinctly seen the

microbe which is considered to be the cause of the scourge which made its first appearance in 1498 with the French soldiers in Italy. Its original absolute incurability, however, was mitigated in the course of time. Men became gradually inoculated by inheritance with traces of the microbic poison, so as to be in a degree protected, and it is expected by scientists that in time the evil will entirely cease. Interesting it is that this evil has become a factor in the civilisation of new countries, inasmuch as it tends to eradicate the original inhabitants, who are not from progeniture inoculated, and not subject otherwise to civilisation. Added to this comes the inevitable whisky, so that two evils combined are found to be, in a sense, factors—very active factors—of civilisation as it proceeds in new countries.

The microbe, or what else it may be called, of the scourge of small-pox has lost its power over man through the timely inoculation of the cow-pox virus into the human blood. It has been made evident by Pasteur that this cow-pox virus is coincident with small-pox virus, merely many a thousandfold attenuated. Hence the consequent efforts of this scientist as to a protection of human blood in a similar manner against the encroachment of microbes which are the cause of a number of infectious diseases.

Some twenty-five years ago Professor Naegeli mentioned some very interesting and, as I believe, important experiments as to the life of the lowest orders of fungi, of which our bacteria are the lowest yet. He prepared a proper neutral nourishing fluid, and put therein the seeds of mould fungi, fermenting fungi and bacteria. The result was that the latter exclusively went on to multiply at the expense of the nourishing fluid, so that not a trace of the other two kinds of fungi could be found. He then added 1 per cent. of tartaric acid to a fresh dish of nourishing fluid. The result now was that the fermenting fungi had the field for themselves exclusively. A third experiment, with 5 per cent. of the acid added to the fluid, gave the field to the mould fungi. Singly each kind of fungi would grow in either kind of nourishing fluid, but in competition with each other the field was conquered by one kind exclusively.

Arguing from this fact, Naegeli justly asserts that the blood corpuscles, as principals within their nourishing fluid, ever prevent the growth therein of other fungi, which are constantly inhaled with the air, thus coming in direct contact with the blood of the lungs. The blood corpuscles ever do this so far as they are in sound condition. But, alas! they are often weak and often subject to debilitating effects, so that the foreign fungi get a chance to grow and multiply, so rapidly indeed—doubling their number within every few minutes—that within a few hours the blood's life, and therewith the life of the being, may be destroyed. Within the child there flows and grows the blood of its parents, and all the latter's ills and ailments that human flesh is heir of accompany the child. The German student expresses this in the jocular statement that every man "should be most careful in the selection of his parents."

A birthplace of bacteria is below the ground, nearest the level of ground-water. As the water recedes the fungi get dry and slowly rise with the ascending air-current to the surface and into the atmosphere, there to be by chance inhaled. Assuming a grain of fine sand to be 1-200 of an inch in diameter, the number of grains per cubic inch is eight millions; further, assuming the interstices between grains at one-fourth, we may safely count thirty-two millions of interstices as taking up the entire space of a cubic inch. A single interstice may thus contain thirty grains of san-dust = 600 blood corpuscles = 24,000 microbes. A single microbe, of medium size, may, therefore, very conveniently ascend within a body of even the finest sand, within the pores of rock, of brick, mortar and concrete. It finds no sort of impediment in any dry substance excepting dense clay, so far as it is not wholly dry. Such clay protects, as is substantiated by the following account of Dr. Pohl:—A country gentleman had on his estate seven one-storey houses inhabited by labourers. These houses were dilapidated and dirty. Their floors were a sort of concrete made of clay. The houses were doomed to be destroyed to make room for commodious tenements of a better class. At a time when cholera visited the place five of the houses had been renewed, with floors raised from the ground, which had been deprived of the layer of clay; two were in their previous condition. The disease laid up eighteen of the inmates of the new and improved, ostensibly far more sanitary houses, and none at all of the two rotten and dirty houses. The result could only be attributed to the fact that the clay floors had effectually prevented any preparatory disease-germs to rise within those houses.

I have at last arrived at my task proper. Bacteria are at all hours generated in the soil under our very homes, they rise, and are inhaled by us as the inmates. Among them there may at any time be some of the kind which cause disease, which might or might not grow at the expense of our blood, as circumstances beyond human control would govern. The upward current, which brings them to us, is augmented in winter, as we well know, by the reverse of temperatures. Where human

well-being and life are considered worth anything, there the architect of the present day should, without fail, pay due attention to such construction of a residence-building as would fairly warrant a protection against all ascending air-currents ever present under its floors and in its walls. The task is neither difficult nor expensive, as we shall see, and no excuse can effectively be offered on this score.

Common materials most likely to be proof against penetration of microbes are asphaltum, glass and pitch-tar. The asphaltum to be had in form of pressed plates. All these materials can be most readily had and employed. Asphaltum or glass, in two layers, on proper mortar, to be put in all walls at the level of lowest floor. Asphaltum also to be put against exterior walls, terminating below lower water-table. Concrete, with level surface, established on the entire ground, to be covered with a coat of pitch-tar and tarred felting, which may be repeated once or twice, to be lastly covered with a proper layer of finish-concrete. Where wooden floors are required, the finish-concrete may contain the required sleepers. Where desired, a further protection can be had by spreading a sheet of lead under the furnace-stand prior to making the last concrete. Even the entire surface of basement may thus be advantageously covered, where expense is no objection.

These arrangements, carefully executed, are unquestionably calculated to produce the nearest positive impregnability of floor and walls of a house, though we must conceive it as next to impossible to give absolute evidence as to such effect. We must rest our assurances on the degree of impregnability on the substances employed and on the accurate manner of their employment.

The arrangement excludes the use of iron sewers, and requires all water-supply pipes to be suspended from the basement ceiling. Return-pipes of a steam-heater and cold-air ducts must likewise be thus suspended. Iron sewer-pipes are objectionable for several reasons. Iron is a bad material to be put under ground. It decays. The decay is augmented by the acids of the liquids within the pipes, and the flow is impeded by rust. Arrangements for cleansing are, therefore, provided at short intervals. Earthen sewers, on the other hand, if well made, are of the most enduring material within our mechanical province, and should not be rejected because they are generally so bunglingly applied by our mechanics. Good sewering requires the excavation of all trenches at one time, and a concave concrete foundation on a gradual and even pitch for all sewers. The sections should be laid in mortar of Portland cement, and connected by means of metallic rings, which will insure permanency. The receiving ends should be fully turned up, and have a socket in which is fitted an iron member receiving the soil of the waste-pipe, both being provided with a tight slip-joint. The joints within the socket to be tightened with a mixture of asphaltum and sulphur.

Provisions thus properly made, with due care and foresight, are unquestionably calculated to secure residence buildings in a desirable measure against the encroachment of those invisible beings which are the ever-present and most persistent enemies of the human race.

THE PARKER STREET LODGING-HOUSE.

AT the last meeting of the London County Council the Housing of the Working Classes Committee reported upon the tenders for the erection of the Parker Street lodging-house. The amounts of the tenders ranged from 13,988*l.* to 18,500*l.* Although the architects of the building, Messrs. Gibson & Russell, had previously warned the Council by letter that, in consequence of the rise in the rate of wages and in the price of materials, their original estimate of the cost of the building would in all probability be exceeded, the committee were not prepared for so great a difference as that disclosed by the tenders. When the committee first reported to the Council in March of last year recommending the erection on the Parker Street site of a model lodging-house, to accommodate 320 persons, the cost of the building, including furnishing, was estimated at 11,000*l.*, and the net return, to yield 4 per cent. upon the outlay and value of the site, was based upon a charge of 4*d.* a bed per night. This estimate was made upon a design prepared by the architect of the Council. Subsequently it was decided to invite designs by public competition, with the result that in the month of May last the design of Messrs. Gibson Russell was selected and adopted. This design had to be remodelled, owing partly to the decision arrived at to open out the Shelton Street area by the acquisition of Messrs. Corben's and Messrs. Hunter & Hyland's premises (which allowed of an increased frontage for the lodging-house), and partly to the necessity of complying with the building regulations of the Council and keeping down the height of the building itself so as not to exceed the width of the street. These circumstances involved the construction of a building of three blocks instead of two, and an additional staircase, meaning an extra expense of about 1,000*l.* The lowest estimate was 13,988*l.*, which was

4,000*l.* more than the original estimate, or 3,000*l.* more if the above circumstances were taken into account. Messrs. Gibson & Russell, the appointed architects, attributed this difference in part to the advance in the cost of building materials and machinery and the rise in wages (which they put together as representing 10 per cent. of the total cost), and in part to items added to the specification at the request of the committee, such as a separate building for laundry purposes, iron and cement divisions to cubicles instead of wood, stone facing to building and granolithic pavement in lieu of cement. The committee had considered whether, having regard to the amount of the tenders, it would be well to omit these items, or some of them, and so reduce the initial outlay, but they were strongly of opinion that as this was the first building of the kind, and one intended to serve as a model, it would be most undesirable to run any risk of not producing a wholly satisfactory result. At the same time they considered it necessary that the sum to be charged per bed should be one which should yield a return of 4 per cent. on the total outlay, and that, in view of the exceptional advantages proposed to be offered of separate cubicles in place of the customary dormitory plan, a somewhat higher charge should be made per bed than 4*d.* a night. The committee were of opinion that, as Messrs. Holloway were known to be builders of experience, it was desirable that their tender should be accepted. If the Council accepted this view, the corrected estimate of the cost of the building would be as follows:—Contract price, 14,300*l.*; cost of furnishing, 750*l.*; architects' commission, clerk of works and quantity surveyor (not considered in original estimate), 1,100*l.*—a total of 16,150*l.* If a charge of 5*d.* per bed per night were made, after due allowance for wages of persons to be employed, for empties and for repairs, a return might be expected of over 4 per cent. on the above sum and on the value of the site, which for that purpose they calculated in the form of ground-rent at 3*d.* a foot, which was probably more than the land would fetch in the market if sold for artisans' dwellings. The definite recommendation the committee now made was:—That, subject to the usual estimate being submitted by the finance committee in accordance with the statute, the Council do accept the tender of Messrs. Holloway Brothers for the erection of the Parker Street lodging-house.

Mr. Acworth moved and Mr. Debenham seconded an amendment referring the report back to the committee for further information in consequence of the large addition to the original estimate.

After some discussion the amendment was negatived.

Mr. Hutton moved a further amendment, "That the committee be instructed to reduce the estimated cost of the Parker Street lodging-house to conform with the original estimate of 10,250*l.*"

Mr. Cobbett seconded.

Earl Compton, M.P., the chairman of the committee, said that personally he was in favour of restricting the price to 4*d.* a bed per night, and he hoped the Council might agree to take a somewhat lower rate of interest than 4 per cent. in order to enable this to be done.

The Council divided, and there voted for the amendment, 25; against, 54; majority against, 29. The recommendation of the committee was agreed to.

BUILDERS' BENEVOLENT INSTITUTION.

THE forty-fourth anniversary dinner in aid of the funds of this institution was held on Thursday, the 5th inst., at Carpenters' Hall, London Wall. Mr. B. E. Nightingale, the president of the institution, occupied the chair, and was supported by Mr. George Plucknett, J.P. (treasurer of the institution), Mr. J. W. Hobbs, Mr. Basil Peto, Mr. B. J. Jacob (warden of the Carpenters' Company), Mr. Howard Clarke, Mr. H. T. Norcroft, Mr. W. Higgs, Mr. C. Bussell, Mr. T. Stirling and other friends of the institution, the company numbering over 150.

The Chairman gave the toasts of "Her Majesty the Queen" and "The Prince and Princess of Wales and the rest of the Royal Family." The Chairman also gave "The Army, Navy and Auxiliary Forces," Major Button responding for the Army and Navy, and Lieutenant Clarke for the Auxiliary Forces.

The Chairman, in proposing the toast of the evening, "Success to the Builders' Benevolent Institution," said that this charity, which had been founded for the purpose of helping those who had been less fortunate than the gentlemen he saw around him, had been in existence some forty-four years. During that time more than 250 persons had been assisted. At present there were 54 pensioners, and several people were waiting the opportunity of receiving their benevolence. The work of assisting their less fortunate brethren was one which should commend itself to the liberality and generous sympathy of all those connected with the trade. They must all have known many men who had "gone under" through no fault of their own, but by stress of circumstances over which they had no control. It was

sufficient to know that men holding at one time good positions had left their widows and families unprovided for, and those who subscribed to this charity were doing their best to help such unfortunate persons. This institution depended entirely on the liberality of the members of the building and allied trades, and was therefore unlike many charities which could appeal to all classes of the community. The Chairman concluded his appeal to the sympathy of his hearers by coupling the toast with the name of Mr. George Plucknett, J.P., the treasurer.

The toast having been duly honoured, Mr. Plucknett replied on behalf of the institution, and said that this year the lamentable strike would influence the receipts of the charity. At the same time, he had such confidence in the builders of London that he did not believe they would allow the institution to dwindle for want of funds. It had now been in existence for many years, and had always managed to meet its requirements. The committee would like to see the income increased, as they were only able to provide relief at present for one out of the four applicants, and thus these old people, who would not live long enough to benefit by the institution, had to stand over for some time.

The Chairman also gave "The Worshipful Company of Carpenters," referring to their kindness in giving the use of their fine hall, and subscribing largely to the funds of the charity.

Mr. B. J. Jacob, warden of the Carpenters' Company, replied, and added that his only regret at these gatherings was that the subscriptions had not amounted to four figures.

Mr. J. W. Hobbs proposed "The Chairman," congratulating Mr. Nightingale on the manner in which he had fulfilled his duties. The trade had been passing through a most serious struggle, which had resulted in heavy loss both to employer and employed, and it required a brave man, with such a fight looming in the distance, to undertake the presidential duties.

The toast was received with acclamation, and the Chairman made a suitable reply.

Mr. Basil Peto gave "The Architects and Surveyors." Although actuated with the best feelings in the world, the builder and the architect, towards the end of a job, sometimes got into a little difference of opinion, and had then to call in the help of the surveyor, who acted as a great "make peace." They could not forget, too, the most unfortunate matters connected with the building trade now under the arbitrament of the President of the Royal Institute of British Architects. His only regret was that more architects were not present at these dinners.

Mr. Howard Clarke replied on behalf of the architects, who, he said, were not without their troubles. The architects of the present day were doing their best to improve London and the provinces, and he need only instance such buildings as the new Metropolitan Assurance Office in Moorgate Street, the new building of the Chartered Accountants, and such buildings as were to be seen on the Thames Embankment, which were worthy of all time.

Mr. Norcroft replied in a humorous speech on behalf of the surveyors.

The remaining toast, viz. "The Vice-Presidents, Committee, and Stewards," was proposed by Mr. Maton and responded to by Mr. J. T. Bolding.

In the course of the evening subscriptions and donations to the amount of 836*l.* were announced, of which sum 576*l.* appeared in the President's list, including his own donation of 100*l.*

BLAST FURNACES.

THE first meeting of the session of the South Staffordshire Institute of Iron and Steelworks Managers was held in the Institute, Dudley, on the 8th inst. Mr. Herbert Pilkington, M.I.M.E., president, read a long and exhaustive paper on "Blast Furnace Plant: Equipment and Design." He said it would be difficult to name any metallurgical appliance which, during the last fifty years, had made such rapid and continuous progress as that of the blast furnace. If they looked back so far they found that the usual output of a furnace would be about 100 tons per week, with a coke consumption of 40 cwt. or thereabouts, whilst at the present time outputs of 700 to 900, and even 1,000 tons per week per furnace were not unusual; whilst with a coke consumption of 20 cwt. per ton, in America, they heard, with wonder and envy, of such prodigious outputs as 2,000 or more tons per week per furnace. Such an extraordinary change had been obtained by vast changes in plant and equipment, in many cases by a total revolution in ideas of furnace practice. Mr. Pilkington then reviewed the more recent changes, especially those which created a greater output with greater economy than usual. The walls of the room were filled with diagrams, some showing patents which saved labour and fuel, and others the best forms of furnaces in England and America. It was found, however, that some of the largest

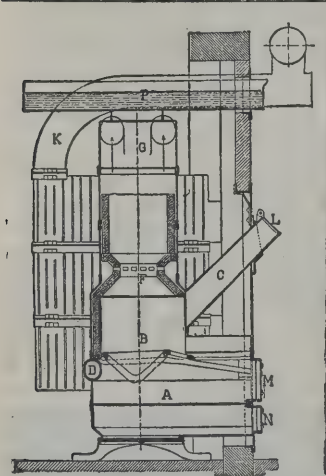
furnaces did not work so economically as the smaller ones. A long discussion followed the reading of the paper, and many of the speakers agreed with the conclusions of the writer, Mr. Hudson remarking that there was but little controversial matter in the paper: still it was full of interest.



ASBESTOS IN THE UNITED STATES.

AN American technical journal supplies in a recent article much interesting information in regard to the production and uses of asbestos in the United States. The mineral is found in a comparatively narrow belt extending along the Piedmont region, or eastern slope of the Appalachian Mountains, from New York through Pennsylvania, Maryland, Virginia, North Carolina and South Carolina into Georgia. It is inferior in quality to the best that is mined in Italy or Canada. Its fibre is comparatively short and somewhat spindle-shaped, with occasional cross fractures, which not only render it brittle, but diminish its tensile strength. Asbestos is also found in considerable quantities in California and Wyoming, but this also lacks the essential quality of strength and fibre. The asbestos of Canada properly belongs to the chrysolite variety of formation. It occurs in serpentine in irregular veins, varying in thickness from a mere film to 6 inches. The fibre extends directly across the vein, is long and even as well as flexible, slightly elastic, and of great tensile strength. The production of asbestos in the United States has shown an annual decrease since 1882. In that year it was 1,200 short tons, in 1883 1,000 short tons, and in 1884 1,000 short tons. The product for 1885 was only 300 short tons, and this was again reduced to 200 short tons in 1886 and 150 short tons in 1887. In 1888 the product was 100 short tons, valued at 30 dols. per ton. In 1889 the only asbestos mined in the country came from California and amounted to 30 tons, valued at 1,800 dols. In spite of this a considerable amount of work was done in developing asbestos mines in Wyoming, but the product was not placed upon the market. The veins and pockets in these mines are said to be numerous, extending in all directions, and to vary in width from a few inches to over 4 feet. Some of the fibre is reported to be over 40 inches in length, but that so far obtained is somewhat brittle, though improving in quality as greater depth is reached. The capital invested in the industry amounted in 1889 to 42,600 dols., of which 41,500 dols. was in land and 600 dols. in buildings, machinery, &c. The total number of men employed in the industry was twelve. Asbestos is used in the manufacture of fireproof paints, roofing, piston packing, felt packing, fireproof cements, sheet and roll mill-boards, flooring, and for a covering for steam pipes and boilers. It is largely used in lining for fireproof safes, and is also made into yarn, cloth and paper. Non-consuming lamp wicks and fireproof drop curtains for theatres are now being made of this material. Some demand has also been created for its use in the manufacture of insulators for electric wires. The fibre of the American asbestos is more brittle and harsh than the foreign product and not so well adapted to the manufacture of spun and woven goods. It is said, however, to stand a greater degree of heat than the Canadian or foreign material, and it is more suitable for the manufacture of fireproof cement and paint, for which the length of fibre is not essential. The import of asbestos to the United States from abroad has rapidly increased from 9,736 dols. in value in 1880 to 263,393 dols. in 1889.

THE COCKSPUR STREET THEATRE.

A REPORT from the Committee on Theatres and Music Halls was submitted at the last meeting of the London County Council. It stated that an amended application had been received from Mr. W. Emden, on behalf of Messrs. Halling, Stone & Pearce, for the approval of ten drawings for a new theatre to accommodate about 1,120 persons, which it was proposed to erect upon the site known as "Waterloo House," being No. 2 Cockspur Street and Nos. 15, 16 and 17 Pall Mall East. In Mr. Emden's former applications, he proposed to place the stage at the Pall Mall end of the site, and the front of the house in Cockspur Street; but in this application the arrangement was reversed, and the stage would be at the Cockspur Street end, and the public entrances and exits in Pall Mall East. This would give the building a wider frontage. The plans now submitted would comply with the Council's present regulations, provided the following amendments were made to them:—(1) The provision of a separate exit into the 12-feet passage-way to the east of the building, and a better arrangement of steps to the staircase on the left side of the vestibule; (2) the substitution of Bostwick gates for those at the end of the passage-way mentioned above; (3) the alteration of the hydrants to positions to be approved by the Council; (4) the carrying down of such portions of the walls of the staircases as are now shown to be supported upon ironwork; (5) the im-

House Cistern, fitted with a Cistern Filter.

PATENT CISTERN FILTERS, Charged Solely with Animal Charcoal. Requiring, when once fixed, NO attention whatever, and superior to any others. *Vide* Professor Frankland's Reports to the Registrar-General, July 1866; November 1867; and May 1870. The *Lancet*, January 12, 1867.
Also, Testimonials from Dr. Hassall, September 23, 1863; the late Dr. Letheby, February 15, 1865, and December 1872.
Price, £1 10s. and upwards. Portable Filters on this System, £1 5s. to £3.
Patronised and used by Her Majesty the Queen at Osborne, by H.R.H. the Prince of Wales at Sandringham, by H.R.H. the Duke of Edinburgh at Eastwell, by H.R.H. the Duke of Connaught at Bagshot Park, by H.R.H. the Duke of Cambridge, the *Elite* of the Medical Profession, and at the London, Middlesex, St. George's, St. Mary's, Consumption, Fever, and German Hospitals, and various Lunatic Asylums, Institutions, Breweries, &c., and at all the Schools established by the School Board for London. Pocket Filters, 4s. 6d. and 6s. each. Household and Fancy Filters, from 10s. Water-Testing Apparatus for detecting Impurities in Water, 10s. 6d. and 21s. each.
Portable Cistern Filters.

157 STRAND, W.C. (Four Doors from Somerset House) LONDON.

provement of the ventilation and the lighting of the lavatories and dressing-rooms in the basement; (6) the improvement of the landing on the stage-exit staircase. The committee recommended that, as pending new regulations the Council is unable to take objection to the application on the ground of the site not being suitable for a new theatre, the plans be approved, subject to the amendments mentioned above being made to them.

Mr. Hutton, for Mr. Torr, moved the addition of the following words to the recommendation:—"But that the Council, whilst approving the plans of the building, is still of opinion that the site is very unsatisfactory for a new theatre, and that the Lord Chamberlain, the Commissioners of Woods and Forests and the applicant be so informed."

After some discussion the amendment was negatived.

ROLLED JOISTS FOR INDIA.

A CIRCULAR has been sent to the various Governments, Commissioners of Provinces, Residents, Agents to the Governor-General, consulting engineers and other heads of administrations by the Government of India respecting rolled joists. It appears that difficulty is sometimes experienced in meeting demands for rolled joists, in consequence of contractors not being able to obtain the exact sections demanded, or the load being specified in addition to the section, without details as to the "condition" of the girder or the limit of stress intended to be allowed. It is therefore suggested by the Public Works Department that demands for rolled joists should be accompanied by a detail of each item to enable the Store Department to supply suitable joists. The central test loads inserted in India Store Depôt Specifications of iron joists have hitherto been calculated on the basis that they should not produce a stress exceeding five tons per square inch of the area of either flange (the calculations are made for joists assorted at both ends, distance from centre to centre of bearings about 1 foot less than the length of the joist). As nearly all the iron joists supplied to India are of foreign (Belgian) manufacture, it is recommended that this limit of stress should not be exceeded. The difficulty of getting rolled iron joists of English manufacture is shown by the fact that, in answer to an advertised tender for them, the War Office received only two offers, and the price was upwards of 9*l.* per ton, whereas the same sections of foreign manufacture were offered at 6*l.* 5*s.* per ton. Rolled steel joists can generally be obtained at from 9*l.* to 10*l.* a ton, and in these the limit of stress may be taken at 7½ tons per square inch, which in some cases would allow of lighter sections being used as compared with iron; the amount of deflection of the steel joists with this stress would, however, be greater than that of the iron joists with a limit of 5 tons. It may be mentioned that although steel joists cost more per ton they will bear a greater strain, weight for weight, than iron joists, as is instanced by the particulars entered on the specifications. This will doubtless be borne in mind in deciding whether steel or iron joists should be demanded.

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.*]

APPLICATIONS FOR PATENTS.

18364. Richard Howard Leaker, for "Improvements relating to louvre windows."

18374. Thomas Simpson, for "An improved window-fastener."

18435. George Henry Bratt, for "Improvements in locks and latches."

18530. Thomas Wilson, for "An improved respirator to be used by firemen in burning buildings or smoky atmospheres."

18543. Thomas Garner, for "Improvements in stench-traps."

18602. Elie Samelson, for "Improvements in gearing for pulley-blocks and winches."

18617. Arthur Foster Smith, for "Improvements in bolts for doors, gates, windows and the like."

18770. William Brenton, for "Improvements in locking-bolts or fastenings."

18828. Sydney Crick, for "Improved means for fastening doors and the like."

18836. Christine Debrunner, for "Improvements in dust-pans."

TO ARCHITECTS AND BUILDERS.

Fountain Street, Bury, and Shiffnall Street, Bolton:
February 13, 1891.

Gentlemen,—We have pleasure in announcing that we have opened extensive Show Rooms at 117 QUEEN VICTORIA STREET, LONDON (opposite Civil Service Stores).

We have been very successful in Lighting and Ventilating Public Buildings in all parts of the Country.

We have a large stock of Sunlights, Turrets, Exhaust Roof Outlets, Tobin's Tubes, Air Grids, &c., &c., at our Show Rooms.

We feel confident that our **DESIGNS**, as well as our system of Lighting and Ventilating will commend themselves to all who are interested in having BRILLIANTLY LIGHTED and WELL-VENTILATED ROOMS.

A visit to our Show Rooms will be esteemed a favour. If inconvenient to call, send for one of our Illustrated Catalogues, inspect our Designs, and read our Testimonials.

Trusting to receive your favours, which shall have our prompt attention,

We remain, Gentlemen, yours obediently, **J. H. PICKUP & CO.**

THE AWARD ON THE CARPENTERS' STRIKE.

As was anticipated, Mr. Macvicar Anderson has, as arbitrator, decided against the claims for increased wages of the carpenters and joiners, who for some time were on strike. He says:—"My award is that on and after the date hereof the code of working rules for carpenters and joiners in the London district shall be:—(1) The working time both in shops and on outdoor jobs to be 51¼ hours for 36 weeks in summer and 47 hours for 16 weeks in winter, equal to an average of 50 hours all the year round. The hour for commencing work to be 6.30 A.M. for the 36 summer weeks, and 7.0 A.M. for the 16 winter weeks. The hour for leaving off work on the first five working days of the week to be 5.15 P.M. for the 36 summer weeks, and 5 P.M. for the sixteen winter weeks, except in the depth of winter on outdoor jobs, when it is to be 4.30 P.M. The hours for leaving off work on Saturdays to be 12 o'clock all the year round. Half an hour to be allowed for breakfast every working day, and one hour to be allowed for dinner on each of the first five working days of the week, except in the depth of winter on outdoor jobs, when half an hour only shall be allowed. The sixteen winter weeks to be reckoned eight weeks on each side of Christmas. (2) The standard rate of wages in shops and on jobs to be 9*d.* per hour. (3) Overtime, when worked at the request of the employers, but not otherwise, to be paid at the following rates per hour:—From 5.15 P.M. in summer and 5 P.M. in winter to 8 P.M., 1*s.*; from 8 P.M. to 10 P.M., 1*s.* 3*d.*; from 10 P.M. to time of starting next morning, 1*s.* 6*d.*; from 12 noon, Saturday, to 4 P.M., 1*s.*; from 4 P.M. on Saturday to time of starting on Monday, 1*s.* 6*d.* No overtime to be reckoned till each full day has been made. (4) Men who are sent from the shop or job, including those engaged in London and sent to the country, shall be allowed, as expenses, 1*s.* per day for any distance over six miles from the shop or job, exclusive of travelling expenses, time occupied in travelling and lodging money. (5) Employers shall provide a lock-up place on jobs, where practicable, and shall take reasonable precautions for securing the safety of workmen's tools, but without incurring responsibility for loss. (6) Employers shall provide, both in shops and on jobs, where practicable and reasonable, a suitable place for the workmen to have their meals, with a labourer to assist in preparing them. (7) Men who are in receipt of full wages, and who have been employed for forty-nine hours in summer, or for forty-five hours in winter, shall on discharge receive one hour's notice, to be occupied so far as practicable in grinding tools, with one hour's pay in addition.

BUILDING AND BUILDERS.

THE station hotel at Perth, which was opened about two years ago, is to be enlarged by the addition of thirty-five bedrooms. The plans have been prepared by Mr. Andrew Heiton, architect; and Messrs. James Hay & Son, Perth, have secured the contract for the work.

IT is stated that the Post-Office authorities contemplate the erection at an early date of a new post-office for Falkirk. A site for the building has been purchased in Vicar Street, within a few minutes' walk of Grahamston railway station.

THE Worcester Board of Guardians have adopted a committee recommendation that the cottage home system be adopted by the Worcester Union in the erection of buildings for the accommodation of the children. Also that the committee be authorised to confer with the architects, Messrs. Rowe & Sons, as to the accommodation that should be provided for the children, and to obtain the plans for the erection of the buildings on the principle of cottage homes.

THE Lichfield Board of Guardians have decided on the erection at the workhouse of a new dining-hall, kitchen, scullery,

"SPHINX" PORTLAND CEMENT

112 lbs. per bushel. Slow setting; test 1,000 lbs. to 1¼ inch; seven days. Fineness, 2,500 meshes to square inch, with less than 10 per cent. residue. Over 10,000 tons supplied to Cardiff and Hereford Water Works.

Specially adapted for Concrete Floors and Street Paving.

"ECLIPSE" PORTLAND CEMENT

Quick setting; test, 8 parts. Standard Testing Sand, 250 lbs. per square inch; 28 days. The finest, most plastic, best sand carrying, and cheapest Cement in the market. Specially adapted for laying encaustic tiles, making joints in sanitary pipes, internal stucco, concrete foundations, &c.

Samples sufficient for Practical Tests Free. Manufactured by

JOHN BOARD & CO., Dunball, Bridgwater.

ESTABLISHED 1844.

washhouse, laundry and boiler-house, at a cost of 2,500*l.*, and the expenditure of 1,000*l.* for the provision of boilers, fittings, &c.

AT a recent meeting the governors of Kendal Grammar School resolved to proceed forthwith with the erection of a new schoolhouse capable of accommodating forty boarders.

AT Dumbarton the Combination Poor-house Committee have adopted plans prepared by Messrs. M'Whannel & Rogerson, architects, Glasgow, for additions to and alterations on the house at a probable cost of 3,400*l.* The plans provide for an enlarged dining-hall capable of accommodating 200, and over this two storeys, giving accommodation for ninety-two additional beds, increased accommodation for the governor and matron, enlarged kitchen and stores and enlarged workshops for the male inmates.

THE Coatbridge Town Council have approved of a recommendation by the Joint Fever Hospital Committee to build additional premises for the housing of the officials, the estimated cost being 600*l.*

A NEW gymnasium at Warrington, built from the plans of Mr. J. E. Wright, architect, by Mr. W. Taylor, contractor, has been opened.

THE parish church of Tallaght has lately been restored. In the eighth century a monastery was founded close to the site of the present church by a Saint Maelrune. All trace of his work has long since disappeared, with the exception of an immense font, measuring some 5 feet in diameter, roughly hewn out from a granite boulder, and which tradition assigns to St Maelrune. Overshadowing this hoary relic of bygone days is another interesting relic of the past in the form of a grand old Anglo-Norman tower, with its ivy-clad walls standing as perfect and strong as on the day when the Anglo-Norman masons completed their work six centuries ago.

THE foundation of the new town hall for Colne has been laid. The work is being carried out from the designs of Mr. Mallinson, architect, and will cost about 8,000*l.*

A SCHOOL erected for the Glasgow School Board, Whitehill Street, Dennistoun, from the designs of Mr. W. F. Salmon, at a cost of 15,050*l.*, has been opened.

IN last week's issue we gave a description of the alterations and extensions carried out upon the Leith Town Hall Buildings. The work, furnishings and decorations have been carried out from plans and designs prepared by Mr. James Simpson, architect, Leith.

THE contract for the erection of a new Board school for Devonport in Stuart Road has been secured by Messrs. Lethbridge & Sons, of the Tracey Building Yard, Plymouth. The price of the contract is about 7,000*l.*

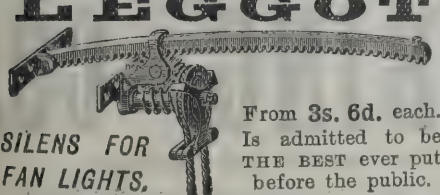
THE First Commissioner of Works has written to Mr. George Dew, the secretary of the London Building Trades Committee, announcing that after "careful and prolonged consideration" eightpence an hour is to be substituted for sevenpence halfpenny for the painters employed on Government work executed by Messrs. Holland & Hannen, who hold a contract from the office of the Chief Commissioner of Works.

IN our issue of November 6 the list of accepted tenders for the proposed public library, museum and school of art at Carlisle was published. Messrs. Bell have since withdrawn their tender, and the next lowest, that of Messrs. J. & W. Baty, has been accepted at 5,871*l.*

TRADE NOTES.

FOR heating the Orrell Free Church, near Wigan, Grundy's patent warm-air ventilating firegrates are being supplied by Mr. John Grundy, of London, and Tyldesley, near Manchester.

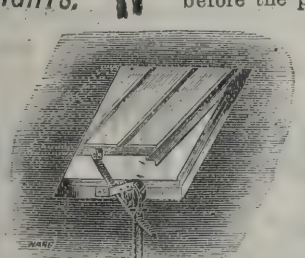
A WROUGHT-IRON SCREEN across the chancel of All Saints Church, South Acton, has just been completed and fixed by Messrs. Jones & Willis, under the superintendence of Mr. Edward Monson, jun., architect. The firm have also in hand a screen of similar character, which, when completed, will be fixed at St. Clement's Church, Fulham Palace Road.



THE new hospitals at Low Moor are being ventilated throughout by means of Shorland's patent exhaust-roof ventilators and vertical inlet tubes, the same being supplied by Mr. E. H. Shorland, of Manchester.

THE improved patent "Æolus" invisible automatic exhaust roof ventilators of Messrs. Baird, Thompson & Co., ventilating engineers, of London and Glasgow, have been adopted for the new Sevenoaks Weald Schools.

THE offices of the Kennedy Buck Machine Co., which we described in *The Architect* a week or two back, are situated at 39 Lombard Street, London, E.C.



A NEW church and schools have been erected at Bedlington. The question of the ventilation received the most careful consideration, and it was decided, after inquiring into the merits of the various systems, that the best was that of

MESSRS. J. CONSTANTINE & SON, of 23 Oxford Street, Manchester, have recently fitted the whole of the baths, and carried out the heating and ventilation of the new Turkish baths at West Hartlepool. Messrs. Constantine have received a testimonial from the directors, stating that they were "highly satisfied with everything."

VARIETIES.

THE sea has been steadily encroaching on the frontage of the parish of Lancing, Sussex, and has frequently made gaps in the road between Worthing and Lancing. The gap now extends for a distance of about 400 feet, and measures from 10 feet to 15 feet deep, and the frontage of about 1,500 yards has no protection against the encroachment. After years of discussion, a committee has been formed, partly of members of the Worthing Town Council and partly of some of the inhabitants of Lancing and others interested; and the committee has instructed Messrs. R. B. Grantham & Son, of London, to prepare plans and specifications for the construction of a number of groins and other works for the protection of the frontage. The groins are to be laid out on the principle which has been adopted with great success on that coast between Lancing and Shoreham, and in Middleton parish, near Bognor.

THE schemes submitted for the Leighton Buzzard water supply and sewerage by Mr. H. Bertram Nichols, C.E., of Birmingham, under the motto "Forward," which were adjudged the best, in the competition which took place last year, by the late parochial committee, have been adopted by the newly-constituted Local Board, and Mr. Nichols has unanimously been appointed engineer to carry out the works. In the water supply scheme it is proposed to pump the water from the Lower Greensand formation, the requisite pressure and storage being obtained from a water tower. The sewerage scheme is partly on the Shone system, four ejector stations being proposed. By this means the whole of the sewers will be confined to the public roads. Something like one-half of the sewage will be raised by pneumatic power into the gravitating main outfall sewer, which sewer will receive many arterial gravitation sewers. The sewage disposal works will be situated to the north of the town, on land adjacent to the River Ouzel. They will be constructed above flood level of the river, and this was demonstrated during the recent heavy floods, when the members of the Board, with Mr. Nichols, visited the proposed site. Adequate flushing of the sewers is proposed, and special means of ventilation will be taken in connection with the compressed air from the ejectors, in addition to the ordinary and usual methods adopted. The population of Leighton Buzzard is about 7,000, and the cost of the engineering works is estimated at about 15,000*l.*

AT an estimated cost of 1,700*l.* new drainage works are to be constructed at Flamborough. The plans adopted have been prepared by Mr. Dyer, of Bridlington Quay. The contract has been let to Mr. Robinson, of Hull.

THE ancient fifteenth-century screen in Manaton Church, which is situated on Dartmoor, five miles from Moretonhampstead, is to be restored. The screen is one of the finest in Devonshire; it runs the whole width of the church, and still has a good deal of its original colouring. The restoration has been placed in the hands of Mr. Edmund Sedding, architect, Plymouth; and Messrs. Rashleigh, Pinwill & Co., of the same town, have been entrusted with the work.

DR. NEILSON, the medical officer of the union, in his annual report, says the improvements that have been made in the lavatories, bath-rooms, &c., in the Basford Union Workhouse hospitals are most satisfactory. Ventilation of the hospital is well effected and warmth maintained, and both may be regarded as excellent. The heating has been improved by the adoption of Shorland's Manchester grates, and the lighting by means of Wenham lights, with pipe flues utilised in extracting the vitiated air. The lighting and ventilation, together with the refitting of the lavatories and baths with the most modern and approved fittings, have been carried out by Messrs. Humphrey & Co., of Nottingham, under the direction of the architect, Mr. Herbert Walker, C.E., Newcastle Chambers, Nottingham.

ACCORDING to the *Standard*, a movement is on foot for the purchase for the nation of an absolutely unique gold cup, not long ago the property of Baron Pichon, of Paris, who valued it at 20,000*l.* It is offered to the country by its present possessor, Mr. Wertheimer, the dealer, for the sum of 8,000*l.*, which he himself paid for it, and he joins, it is said, with several distinguished amateurs in a subscription towards raising a considerable part, or it may be, even the whole of this sum. The cup, which is some 6 inches high, and wrought exquisitely, is very possibly of English origin. It was, in any case, during several generations, among the English crown jewels. It

ceased, we believe, to appear in the inventory of these about the period of James I., and for a long time subsequently its home was a convent near Burgos.

ABOUT 7,000 men are employed on the construction of the canal through the province of Schleswig-Holstein to connect the North Sea with the Baltic. About 7,000 workmen are employed in the construction. They are in 38 camps, of 160 to 500 men each, each camp having its own executive office and sleeping barracks. The common labourers get about 70 cents. a day, and the foreman and skilled labourers get from 95 cents. to 1.15 dols. a day. The mechanical appliances are 27 dry dredgers, 24 floating dredgers, 97 locomotives, about 62 miles of track, 2,700 dirt-carts, 4 elevators, 15 steamboats, 51 receptacles for dredging implements and 37 steam-pumps. Along the line are several forges and two brickyards.

UPON the formation of the Salt Union, Mr. Joseph Verdin, whose works had been absorbed by the union, gave the sum of 26,000*l.*, to form the nucleus of a fund for providing compensation to property owners in the salt district who suffered from the subsidence. The recent passing into law of the Salt Subsidence Compensation Bill has obviated the necessity for recourse to any special fund, and Mr. Verdin has consequently decided to hand 6,000*l.* over to the Victoria Infirmary, Northwich, and to devote the 20,000*l.* remaining to the promotion of technical education in Northwich and Wensford.

A BILL will be introduced in the next session by the Hampstead, St. Pancras and Charing Cross Railway Company seeking powers to construct an underground railway from Hampstead to Charing Cross, the line of route following as nearly as possible the main thoroughfares between Charing Cross and the north-western suburb, viz. Tottenham Court Road, Hampstead Road, Camden Town and Haverstock Hill.

THE following recommendation has been adopted by a majority of the London County Council :—"That, subject to an estimate being submitted to it by the Finance Committee, as required by the statute, and to the Hackney district board entering into an agreement with the Council to contribute 10,000, or one-fifth of the cost, the Council do offer 50,000*l.* for Hackney Marsh, such sum to include the rights of commoners, the lord of the manor and all other owners, and that in the event of the Council agreeing to the expenditure the solicitor do make the offer on its behalf."

A POPULAR handbook to the Ruskin Museum at Sheffield has been prepared by the curator. It is not only descriptive of the chief objects exhibited, but explanatory of their meaning, of their place in the teachings of the museum and their bearing on the lessons which Mr. Ruskin designs the collection to impart. It is introduced by this motto from Mr. Ruskin's writings: "The right function of every museum is what is lovely in the life of nature and heroic in the life of men."

AT the Leeds Assizes, Messrs. R. Galsworthy & Sons, in an action against the Selby Drainage Commissioners to recover damages for the subsidence of a tan-yard at Selby through the negligence of the Commissioners in carrying out their drainage scheme, obtained judgment for 1,626*l.* The Court of Queen's Bench has now issued a mandamus commanding the Commissioners to levy a rate to satisfy the judgment, with costs, against the Commissioners. The Commissioners' case was that they had no powers to levy a rate for the purpose.

THE report of Mr. Wyatt, engineer, on the Craven Arms water supply has been accepted by the Ludlow Board of Guardians. Mr. Wyatt, in his report, said he had come to the conclusion that it was advisable that the Board should abandon the scheme which had lately been before them, and adopt a pumping scheme. His reasons for this were the high terms demanded for easement for one portion of the pipe line, the fickle nature of the supply necessitating large storage room, and the relative hardness of the water. The water pumped from the trial boring in Long Lane had considerably less than half the hardness of the springs at Denchope. He had made a boring, and water was met with at a distance of 20 feet. For the pumping power he should use a windmill. The total cost of the works he estimated at 1,900*l.* It was decided to discuss the question at the next meeting.

AT a meeting of the Hospitals Sub-Committee of the Leeds Corporation it was decided that steps should be taken to find a suitable site for an infectious diseases hospital, and that the committee should be empowered to visit other towns with a view of ascertaining the best form of hospital for infectious diseases existing in the country.

THE Wallasey Local Board have decided that the necessary steps should be taken to apply to the Local Government Board for a provisional order to sanction the borrowing of 50,000*l.* for new gasworks.

THE total cost of the improvement works proposed to be carried out by the Blackburn Town Council, and for which Parliamentary powers are to be applied for, is estimated at 250,000*l.*

VOLUME XLV. OF THE ARCHITECT.
Handsomely bound in Cloth, Gilt Lettered. Price 12*s.* 6*d.*—Office: 175 Strand, London, W.C.

AN inspection of Arbroath Railway Station has been made by engineers of the North British and Caledonian Companies, the companies interested in the station as owners of the Dundee and Arbroath Joint Line. It is understood that the engineers have recommended extensive alterations.

AMONG the Bills for the forthcoming session of Parliament will be one for the main drainage of Blackrock, a residential district in co. Dublin.

THE Bath Waterworks Committee recommend an increased water supply by purchasing springs known as Taylor Springs, at a cost of 18,000*l.*, with 400*l.* annually for pumping.

AT the inquiry held at Dudley into the proposal to borrow 5,000*l.* for public improvements, it was explained that 1,300*l.* was wanted for the Priory Street property, on which to build a fire-station ; 2,500*l.* for the Stone Street property, to widen the thoroughfare and provide increased market accommodation ; 926*l.* for a recreation-ground at the Buffery, and 300*l.* for one at Eve Hill.

THE Works Committee of the Aberdeen Harbour Board have agreed to protect the works at the Waterloo Quay wall by additional sheet piling, several parts of the wall having fallen. The estimated cost is 1,000*l.*

THE owner of the greater part of Prestatyn, Mr. H. D. Pochin, of Bodnant, intends to provide at his own cost a gas supply for the town, thus largely increasing its attractiveness both for residents and visitors. During the last year or two Mr. Pochin has built largely and laid out new streets, and it is understood that he has other improvements in view.

THE new tariff, which awaits the approval of the French Senate, will be prohibitive of English metals. On bar iron a duty of 2*l.* a ton, sheet iron 3*l.* 15*s.*; bolts, nuts, hinges, &c. 6*l.*; nails, 5*l.* 17*s.* 6*d.*, cast tubes, 4*l.*, lap-welded tubes, 7*l.* 10*s.*, hollow-ware, 12*l.* 10*s.* a ton, will be imposed.

AMONG the Parliamentary notices is one for forming a dock thirty acres in extent at Tranmere, on the Cheshire side of the Mersey. In addition to the dock, it is proposed by the London and North-Western and Great Western Companies, to build a river wall 5,000 feet long and a railway which will join the Birkenhead and Chester lines of the joint railways.

THE Christmas number of the *Ladies' Pictorial* this year, as in previous years, is delightfully printed, contains excellent illustrations, and most interesting reading matter. As in former cases, the proprietors seem to have spared no expense in the reproduction of their special plate, which is, if anything, even finer than their last year's, when they had probably the finest plate of any of the other illustrated papers.

On November 30, Mr. Gilbert Dalziel will publish *Judy* almanac for 1892, which will be fully illustrated by M. Greiffenhagen, William Parkinson, A. Chasemore, Alfred Bryan, Fred. Pegram, C. H. Marshall, H. R. Millar, J. B. Clark, Hal. Ludlow, E. G. Beach and W. F. Thomas. A specialty will be found in the extra four-page musical supplement, "Judy's Minuet," by Edward Solomon, composer of "The Nautch Girl," &c.

AMERICAN NOTES.

THE commissioners appointed to devise a scheme of rapid transit for New York city have recommended an underground system of railways in tunnels on each side of Manhattan Island, from the Yonkers line to the Battery, and a cross-town tunnel under Union Square. Express trains on special tracks to run forty miles an hour. Electricity to be the motive power and to light the tunnels. The block system to prevent accidents is proposed, and good ventilation, doing away with smoke, steam and discomfort, will be provided.

Stone of Indianapolis says :—Contracts for all the principal buildings for the World's Fair have been let and several of them are half completed. It has been ably managed, and the vast proportions of the work, the necessity for striking and artistic architectural effects and the enormous mass of detail involved have been so well considered that the whole reflects great credit upon all who have had the work in charge. The completed designs will prove, we think, that the United States' architects are peers to those of the world.

THE same paper says :—There is a decided and growing sentiment against the high-building craze that has been rampant in Chicago and other cities of late years, and in Chicago there is an effort to limit it by municipal law to eight storeys. So long as a certain number of office buildings are required on a limited area the venture will be safe so long as the demand be not greatly exceeded. But to build miles of such buildings will be to waste capital in a way that cannot be returned, and even if the craze is left unaffected by municipal enactment it will destroy itself by its own excess.

AT the meeting of the Engineers' Club of Cincinnati, Mr. A. O. Elzner read a paper on "The Engineer and Architect." He called attention, the *Engineering News* of New York says,

to the intimate relations between the professions and the difficulty sometimes to know where to draw the line, and noted that many of the magnificent ancient works of so-called architecture certainly combined in their construction the ability of both the engineer and the architect. The professions must evidently depend upon each other for assistance in the carrying out of many of the large works of the present time, or else an architect must be an engineer, or an engineer combine the qualifications of the architect. This is illustrated in the fact that the Board of Architects of the World's Fair buildings at Chicago simply design and determine exteriors for the various buildings, while the work of preparing detailed plans, specifications, the necessary calculations and the construction are all in the hands of a separate engineer department. Many of the improvements and much of the economy in the construction of the present day are due to the assistance of each profession to the other. Incidental to the paper was a reference to and general description of the construction of the tall modern buildings of iron or steel framing encased in brick or terra-cotta.

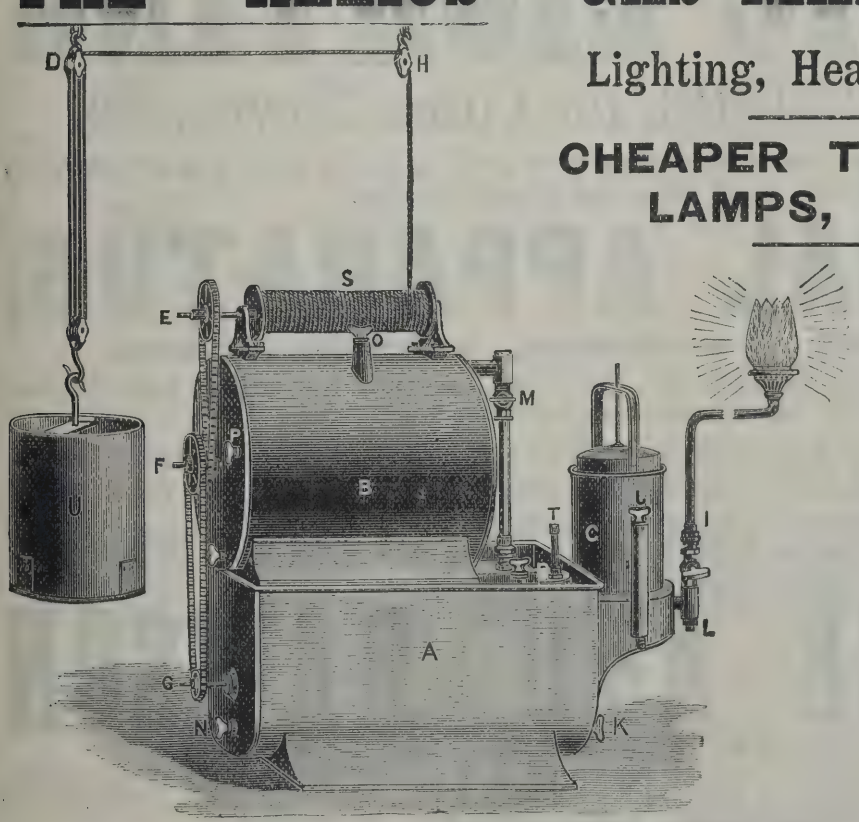
THE marble tower of the Philadelphia City Hall, rising to a height of 337 feet 4½ inches above the pavement of the court-yard, is to be surmounted by a clock storey of iron, 67 feet 8 inches, and this by a pyramidal dome of aluminium, 105 feet 7 inches high, the whole capped by a bronze figure of William Penn, 37 feet tall. The iron clock storey is finished and set up on the grounds of the Tacony Iron and Metal Company at Tacony, Pa.

THE United States Department of Agriculture, through the Forestry Division, has commenced an investigation of the physical properties of American timbers as related to their conditions of growth and the uses to which they are put. The results, which should prove of value to engineers, architects, builders, and to the public generally, will be made public as fast as obtained.

THE *Builder and Woodworker* of New York says :—The characteristic English dwelling is described as a two-storey brick house, walled in and with the best part of the house at the back. There are the drawing and dining-rooms, while the kitchen and pantries are in front. In suburban and country houses the rooms are large and are arranged around a hall, but the windows and doors are small. The outside of the house is almost uniformly without architectural decorations, and the dulness of the climate is seen in the sombreness of the furniture and the adornments of the house. The interior is dull and uncheery. There is little "sweetness or light" in the colours, forms and expressions, except in the dwellings of more recent building and furnishing. Up to within a few years the inside finish was all of dark wood, and the furniture was mahogany of very heavy and ungainly construction. But if you can dissociate the idea of comfort from that of art, the English home has a very marked spirit of comfort.

OF high buildings in Chicago *Harper's Weekly* says the highest building at present (and one which is not built on the new Chicago construction system) is the Auditorim. Its loftiest point is 296 feet above the sidewalk. The Fair building, now almost completed in one section, measures 241 feet to the coping, and it is possible that it will be carried higher—to 16 or 18 storeys. The new Masonic Temple will measure over all 274 feet. This is constructed entirely on the new system. The Ashland block measures 210 feet to the coping; the Woman's Temple, whose topmost storeys are now being finished, 266 feet; the Manhattan, 198 feet; Monadnock, 194; Henning and Speed block, 192; Abstract building, 190; Chamber of Commerce block, 180: Home Insurance, 178; Tacoma, 175; Northern hotel, 174; Rookery, 164; Owings block, 161; Rand-McNally, 148; Chicago Opera House, 135; and the L.Z. Leiter building, 133 feet.

THE *American Engineer* of Chicago says :—The Department of Transportation is offered one of the most valuable relics of the early days of railroading in this country, and will doubtless secure it for an exhibit. The old locomotive "Samson," built in England in "the thirties" by the celebrated Timothy Hackworth, and brought to this country in 1838, is still in existence and in working order. Accompanying it is a quaint old passenger-car built in imitation of a stage coach, both standing on some of the old scolloped or fish-belly rails. The engineer who first ran the locomotive is still alive, and if still living at the time of the World's Fair may accompany the venerable engine.



THE *Builder and Decorator*, Philadelphia, says :—A twenty-six storey building is now proposed for Lower Broadway, New York. It is to be constructed on the plan proposed and put in practice in Chicago in the past few years. The interior to be of steel framework, so that it would be strong and stand without walls, and resist any known wind pressure. It is supposed that it will cost 4,000,000 dols., and will be the tallest building in the world.

THE "HELIOS" GAS-MAKING MACHINE

FOR

Lighting, Heating, and Motive Power.

CHEAPER THAN COAL GAS, OIL LAMPS, OR ELECTRICITY.

This Machine is the latest development of the Oil Gas systems. In most other such machines Gasoline is the gas-producing material, and as this can only be procured in large quantities, and is dangerous to store, there is naturally a great objection to its employment. The "Helios" Gas Machine is charged with Benzoline, which can be procured anywhere in large or small quantities. The Machine is simple, and the light produced far superior to coal gas. Machines made to supply from 6 to 2,000 lights.

Prices from £10 10s.

UNEQUALLED FOR

COUNTRY HOUSES, FACTORIES, HOTELS, &c.

FOR FURTHER PARTICULARS APPLY TO

THE INCANDESCENT GAS LIGHT CO., LIM.

14 PALMER STREET, WESTMINSTER, LONDON.

THE Lake Hemet dam, the San Diego *Sun* says, will be 150 feet high and 200 feet thick at the base. It will be built of granite laid in Portland cement, is situated in the northern part of San Diego county, and will flood an area twice as great as that of the Sweetwater reservoir.

THE STAFFORDSHIRE INFIRMARY.

IT was proposed a couple of years ago to erect a new infirmary in Stafford with all modern improvements. The cost was calculated at 10,000*l.*, but an estimate being prepared by Mr. K. D. Young it was found that the building would amount to 13,000*l.*, exclusive of cost of site. But as sufficient money was not obtainable it was decided to remodel the present building. Accordingly a meeting has been held at which the following recommendation was submitted by the executive committee :—

(*a*) That the insufficiency of the funds available, coupled with the difficulty of obtaining suitable land, will render it impossible to re-erect the hospital on a new site. (*b*) That, as the only practical solution of the question, they recommend that the present site be utilised, and that as a commencement of what they hope may ultimately lead to an entire reconstruction on modern principles of the existing hospital, new wards, to accommodate twenty-eight patients, be at once erected on the vacant land to the north of the building. (*c*) That they have consulted an eminent architect, Mr. Aston Webb, of Queen Anne's Gate, Westminster, upon the subject, and have ascertained that the proposed new wards, erected on the most modern principles and with all suitable appliances, would cost from 3,600*l.* to 4,000*l.*

The following report by Mr. Aston Webb was read :—

"19 Queen Anne's Gate, Westminster, S.W. :
"October 21, 1891.

"My Lords and Gentlemen,—In accordance with your instructions I have inspected the present site and buildings and carefully considered the feasibility of a gradual rebuilding of your infirmary on the present site as funds will allow. I may say that I entirely concur with Mr. Gordon Smith as to the impracticability of satisfactorily remodelling the present building, but that I am of opinion that a gradual rebuilding could be carried out which would, when complete, provide practically a new infirmary in accordance with modern requirements and free from the defects pointed out by Mr. Gordon Smith in the present building. To make my proposals clearer I append to this report three sketch-plans:—No. 1, showing the building and site as at present ; No. 2, showing the blocks of new wards proposed to be first built ; No. 3, showing the entire building as proposed to be completed. I should recommend that two entirely new blocks of wards, containing twenty-eight beds in two floors in each block, be first erected at the north and south extremities of the present building, each ward having an aspect of east and west, and provided with all the necessary closets, lavatories and sinks at the one end and proper ward-kitchens, bathrooms, &c., at the other ; these offices being in all cases aërially separated from the wards, as the wards would themselves be from the centre block. These wards are shown on drawing No. 2, and it will be seen that they are within the limit of 80 feet from Foregate Street, within which Mr. Gordon Smith considers the present site 'fairly eligible.'

"When these blocks are erected fifty-six beds would be provided, free from the objections pointed out by Mr. Gordon Smith in the old building, and fitted with every modern requirement. If desired the A block could be built first, and subsequently the B block, and both could practically be erected without any disturbance to the patients until the wards were ready for their reception. When B block was built it would be necessary to pull down the present fever wards, which I understand are shortly to be vacated, and to erect mortuary and post-mortem rooms elsewhere, a site for which I have suggested at D on the plans. When these blocks are built, and until the funds permit of the scheme being completed, I should suggest that the present wards on the west front be closed. A portion of those on the east would be required for corridors, to connect the new wards to the present building, and the remaining portions would be available for day-rooms.

"I should also propose to divide the central ward on the first floor into cubicles, and bring the nurses down from their present very inadequate quarters on the second floor into them, or should it be deemed advisable to keep this as a ward, then some of the closed wards on the first floor could be used for the purpose. This would still leave the out-patients' department very badly provided for, and urgently requiring to be rebuilt, though it would no longer be under any of the wards. I should propose therefore that this be the next thing to be taken in hand, and might be erected on a site marked G on the plan No. 3, being connected by a corridor to the basement storey of block A, the present carpenter's shop and piggeries being removed.

"After this, the closed wards of the present building should

be removed, and this would entail the removal of the present kitchens, which might then be accommodated on the top floor of the central block. New day-rooms, separation wards and ward staircases would be added adjoining the new ward kitchens, and connected by bridges to the central block, as shown on drawing No. 3. The central block would require a certain amount of remodelling, and the buildings would then be completed, as shown on the drawing No. 3.

"In accordance with your wish, I have not worked out the scheme in great detail; this would have to be done later; but I have done so sufficiently to satisfy myself of its feasibility, subject to such alterations in detail as would no doubt be suggested in conference with yourselves and the medical staff.

"In regard to the question of cost, I have gone into this as regards the new wards, shown on drawing No. 2 in considerable detail, and estimate that these blocks could each be erected for a sum of 3,600*l.* or 7,200*l.* the two (A and B) complete, with an addition of 300*l.* for the post-mortem and mortuary-rooms. With regard to the out-patients' department and the completion of the building, as shown on drawing No. 3, I have not the data for arriving at a close estimate, but it may be convenient if I say that I should approximately put the cost of the out-patients' department at 1,600*l.* and the addition of day-rooms, separation wards, remodelling the central block, at 4,000*l.*"

The Governors and subscribers have decided to adopt the report and recommendations of the Executive Committee, the expenditure being limited to 4,000*l.*

PILING ON FORESHORES.

AT the second ordinary meeting of the Liverpool Engineering Society Mr. John J. Potts read a paper entitled "Notes on Screwing Cast-iron and Driving Greenheart Piles at St. Anne's-on-Sea, Lancashire." These notes were taken during the reconstruction and completion of the jetty (of which the piles form a portion) for the landing of passengers from the excursion-steamers situate at the outshore end of the promenade-pier at St. Anne's-on-the Sea. Borings on the site showed that hard clay was reached after from 8 feet to 11 feet of compact sand and gravel had been sunk through. The screw-piles, which are all open hollow cast-iron tubes with screw blade at the bottom and 3 feet in diameter and 6 inches pitch, were screwed through the sand and gravel into the hard clay. A description was given of the gear employed and the precautions taken, it being tide work for getting both the upright and raking piles to the required depth, also particulars of the mode of working, the number of men necessary for each arrangement of the gear, the time spent in screwing, the rate of progress and the power developed in screwing the piles down. Owing to the nature of the foreshore it was arduous work screwing the piles in place, and the difficulty was increased where the capstan had to be reduced in diameter on account of the existing columns in the original structure being in the way. The piling-engine for driving the greenheart piles was of the usual construction, the tup being of cast-iron and weighing 19½ cwts. Particulars of the mode of working and of the behaviour of the piles during driving, with the precautions taken for preventing splitting, twisting, &c., the time occupied in driving and the number of men employed were also given. These piles being driven from above high-water level after once being pitched, it was not such tedious work as with the screw-piles.

FIRE INSURANCES.

IN the Edinburgh Court of Session last week an appeal was heard in an action brought by Andrew Gilmour, Blantyre, against the Caledonian Insurance Company, George Street, Edinburgh, for 1,700*l.* He insured shops and dwelling-houses with the company, and sustained loss to the amount sued for by fire. The company refused to pay more than 1,350*l.* They said that under the policy any dispute as to the amount of loss must be submitted to arbitration, and they maintained that the sum claimed was a gross over-statement of the value. On June 23 last Lord Stornmonth Darling repelled the defenders' pleas as to arbitration, and appointed the case to be put on the roll for further procedure. On a reclaiming note the First Division adhered to the Lord Ordinary's interlocutor, and the company sought for leave to appeal to the House of Lords from this interlocutory judgment.

After hearing counsel, the Lord President delivered judgment. His lordship stated that if he had only to consider the interests of the insurance company he would have been quite willing to grant leave, but much more had to be considered, viz. the interests of the pursuer, Mr. Gilmour. Counsel had stated that it was of great importance to the company for future guidance that they should have a judgment of the House of Lords; but while this might be true so far as the company was

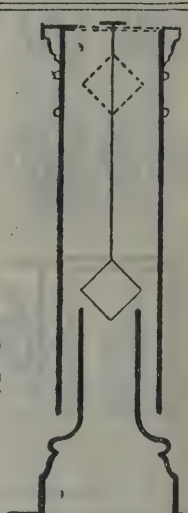
concerned, the pursuer should not be made to suffer in any way for the purposes of testing the law as to the company's conditions of its policies. Therefore he was of opinion on this and other grounds that leave should not be granted. The other judges concurred.

As inconvenience has been caused in England by the working of the arbitration clause, a "Templar" calls attention to the subject in the *Times*. He says:—It will assuredly prove an unpleasant surprise to many to learn that the question whether policies are to afford us any protection or not does not in any way depend upon our fulfilling our part of the contract, viz. the payment of the annual premiums, but simply and absolutely upon the extent to which the particular insurance company may choose to take advantage of the "arbitration clause." I can give a pointed illustration of this in the facts of a case which came directly under my knowledge a few years ago. A small tradesman had insured his stock for some 700*l*., and when this had been wholly destroyed by fire, he made his claim in due course on one of the oldest and best-known of our great insurance companies. He was immediately met by the "arbitration clause" being set up, which, let it be remembered, in this as in all other cases provides that the company shall not be bound in respect of any claim unless and until the amount of the liability, if not admitted, shall have been referred to arbitration, and that an award shall be a condition precedent to any right of action to enforce a claim at law. The unhappy small tradesman was thus driven to arbitration, and in the result an award was made assessing his loss at some 600*l*. The company had done all in its power to pile up the costs of the arbitration, and the tradesman, having had to pay his own costs, was at this point between 400*l*. and 500*l*. out of pocket. This was bad enough, but he did not realise the true character of his position until, having made his claim upon the company for his 600*l*., he was coolly informed that he would then not receive a halfpenny, but that he could proceed, if he chose to do so, to bring his action to enforce such claim. He of course then learnt that the arbitration had merely decided that if he could bring his action and succeed in it he might, at the end of protracted litigation, be entitled to his 600*l*. The sequel, which could easily have been, and probably in fact was, anticipated by the insurance company, was simply that the unhappy small tradesman, having exhausted the whole of his means over the arbitration, could find no money for litigation, and so failed to recover a farthing under his policy. Now, sir, I venture to assert that such a condition of affairs as both can be and is maintained by the "arbitration clause" in our policies ought not to be possible, and further that it would be easy enough for the public to force the insurance companies to put an end to it. I contend that the clause ought either to be expunged from all policies or so altered as to make the awards under its terms final not only as to the amount to be recovered by the assured, but also as to the liability of the insurance companies, and, what is absolutely necessary too, carry costs. Let it not be supposed that, because we hear very little in our Courts of cases in which insurance companies have made an unscrupulous use of their terrible powers under the "arbitration clause," such cases are rare. The fact is that there seems practically nothing at which the insurance offices will stick to escape their liabilities. A curious instance of this was brought to my knowledge some little time back. A fire having taken place in a factory in London, the assessor tried the usual trick of offering to pay a portion of the claim made by the assured. Finding he had a wealthy firm to deal with, and that the case was one of the rare ones in which the assured could not be forced to accept that which the insurance office chose to offer, he set to work to fight every item tooth and nail. Will it be believed that one of such items which the insurance office refused to pay was the very moderate value placed upon an ordinary clock on the ground that it was "no part of the plant?" And this, too, when the assured was liable under the provisions of the Factory Acts to a heavy fine if he failed to have a clock on his premises.

WOODHOUSE & RAWSON UNITED, LIMITED.



THE third ordinary general meeting of this company has just been held at the Cannon Street Hotel. Sir Rawson W. Rawson, K.C.M.G., C.B., the chairman, who presided, in the course of his address said:—Considering the extraordinary financial crisis that has occurred during the two years of our existence and the general commercial depression which ensued, we trust you will think the results of the operations of the company eminently satisfactory. Turning to the balance-sheet and looking to the profit and loss account, you will find, deducting from both sides of the account the amount of 16,000*l*. brought forward from the previous year, that the total earnings of the company amounted to 89,000*l*. Out of that we have provided for all our current expenses; we have provided for writing off what we consider a sufficient amount in the reduction of the value of our patents. We have paid

THE
"CLIMAX" VENTILATING CO.'S
DIRECT ACTING
CHIMNEY COWL,
For the Preventing a Blow-down.

This Cowl is specially designed for preventing a blow-down and assisting the up-draught. It is admittedly the most efficient in the market. Its construction is scientifically and mathematically correct, and no matter from what direction the wind strikes it, a powerful upward current is established. It is noiseless, has no movable parts to get out of order, is easily cleaned, the cone over inner shaft being made to push up. It has THE very decided advantage over every other Cowl, IT IS SIGHTLY.

the interest due upon our debentures, and we have written off 10,500*l.* of extraordinary expenses, some of which might fairly have been distributed over a further term of years. Then we leave a balance of 35,000*l.* to meet our dividends. The dividend which we promised, and were certainly pledged to, was 15 per cent. on our ordinary shares and 8 per cent. on our preference shares, and those dividends amount to 30,500*l.* Consequently we have a surplus of 4,600*l.* applicable to such purposes as may be thought fit. If we add to that the 10,000*l.* of extraordinary expenditure, our earnings during the year were 35,000*l.* above our current expenses, and that without trenching upon the 16,000*l.* carried forward from the previous year. Now, gentlemen, the directors hold, and we trust that you will hold, that in such an extraordinary year as that through which we have passed the result is satisfactory. It was a year, remember, affecting peculiarly this company, because one of the branches of the business of this company is to fully test new inventions, to utilise all the patents which it possesses, and to interest the public in new inventions connected chiefly with electricity. Well, this has been a year in which the public have not been disposed to enter into new undertakings, and consequently we have had very little encouragement. There is not much to notice on the debit side of the balance-sheet. We have reduced the mortgage on freehold property by 3,000*l.* The sundry creditors stand at 8,000*l.* less, and we have swept away the whole of the guarantee fund of 75,000*l.* We have refunded that to Woodhouse & Rawson, Limited, according to the authority which you gave us at the previous meeting, and therefore that disappears from our balance-sheet. You will find entered for the first time a reserve fund of 25,000*l.*, and our employes' pension fund of 1,065*l.* Turning to the credit side, there is an increase in freehold premises of 12,000*l.*, which is caused by the building and improved engine power erected at Cadby Hall, and also sundry improvements in the Kidsgrove property, which was taken over at the commencement of the year, and necessitated certain outlay. There is a small item of increase in regard to the leasehold premises. The next three items are heavy ones, viz. plant, stock, and expenditure on contracts. These are increased, but the explanation is very simple. The United Company has acquired new works, having made a new organisation, and having extended its business, I may say, throughout the world. Necessarily we had to make a large outlay on our works for plant, on our supply stations for stock, and on our installation and contract works for the work in progress. In fact, what did we ask money for but to extend our business? and the explanation of these increased items is simply that we have extended our operations. With regard to the report, I am able to speak of the very great improvement that has been made at the West Kensington Works by the erection of a new block of buildings there and a new engine-house, which will enable us to undertake a class of business likely to prove highly profitable. One of the great sources of our credit and profit is our manufacture of specialties. This new block will enable us to undertake on a large scale the manufacture of mechanical apparatus as well. With regard to the Kidsgrove Works, we only entered into possession at the commencement of the year. It was a business that required considerable improvements in many ways, and we had to carry out, at a disadvantage in many respects, the works begun by the previous owners. The object of acquiring the Union Foundry was this: we possessed the means of making all electrical apparatus of a small character, but we had no works in which we could on a large scale manufacture dynamos and engines peculiar to electrical apparatus, and to introduce new inventions—specialties, I call them—such as are noticed in the report—hydraulic engines, electric cranes, and things of that kind. With regard to the supply department, that is going on satisfactorily. A very important matter is with regard to the Epstein accumulator. We have had the Epstein accumulator under observation and testing for two years, and the result is as satisfactory as we could possibly desire.

THE ARBITRATION CLAUSE.

ON Monday in the Queen's Bench Division, before Lord Coleridge and Mr. Justice Wright, the case Eyre *v.* the Corporation of Leicester was heard. This case raised a question of some importance as to the effect of the "arbitration clause," which is now so common in all contracts of any importance, that "disputes and differences shall be referred to arbitration," and especially as to the effect of the Arbitration Act, 1889, with reference to the power of the Court to appoint an arbitrator—if the parties cannot agree upon one—in order to carry out an arbitration clause in a contract. The Act (sec. 5) provides that where there is a provision in a contract for reference of differences to an arbitrator, and the parties do not, after differences have arisen, concur in the appointment, either party may give written notice to appoint an arbitrator, and if it is not done after seven clear days, then the Court or a judge may appoint

A High-class Sanitary Distemper for Outside and Inside Walls and Ceilings of Public and Private Buildings, Government Offices, Banks, Colleges, Schools, Warehouses, Offices, Railway Stations, Factories, Asylums, Hospitals, Churches, Chapels, Cottages, Coach Houses, Laundries.

an arbitrator, &c. In this matter Mr. Eyre, the plaintiff, a contractor, had been employed by the Corporation of Leicester to construct a main sewer, &c., and the contract (October 1888) contained a clause which provided that the contract should be carried out according to certain general conditions (one of which was for reference of disputes to arbitration), and "the submission hereby made and the award made by the arbitrator or umpire to be appointed in accordance with the condition for reference to arbitration," which was in these terms: — "That every dispute, question, difference or controversy arising between the borough surveyor and the contractor (except as to matters or things left to the sole decision of the borough surveyor under these conditions) shall, after the completion and delivery of the work, and after the final certificate by the borough surveyor, be referred to arbitration pursuant to the provisions of the Common Law Procedure Act, 1854, or any Act or Acts amending the same." The contract, it will be seen, was before the Arbitration Act, 1889, but the Court of Appeal have held that the Act applies to existing arbitrations. When the work was completed the contractor made certain claims for sums beyond the amount in the contract, amounting to between 7,000*l.* and 8,000*l.*, of which 1,277*l.* was for extras and the rest for damages for alleged injury to the works by bad water-pipes, &c., and a claim of 1,165*l.* for damage caused by insufficiency of sewers to carry off waste water, to which there was a counterclaim of about 500*l.*, and in April last his solicitors wrote to the solicitors for the Corporation, that he was as of right entitled to arbitration, and calling upon them to appoint an arbitrator. They, however, denied that he was so entitled, and in July he sent to them a notice "to concur with him in the appointment of a sole arbitrator to act in the above-mentioned matter for the purposes of the submission to arbitration under the agreement, and that in default he would be entitled after seven clear days to proceed under the Arbitration Act. They, however, still refused to comply, and then the contractor applied to a Master for an order under the Act, and he declined to make it, saying that the notice was not according to the Act, and the Judge at Chambers (Baron Pollock) concurred in this view, and declined to make any order. The contractor now appealed against that decision.

On behalf of the contractor in support of the appeal, it was urged that the case was clearly a case for reference to arbitration under the arbitration clause, and that the power of the Court to appoint an arbitrator applied under the notice, and that it was a valid notice to appoint a single arbitrator.

On the part of the Corporation, it was contended that there was nothing to indicate that there was to be a single arbitrator, and that the allusion to an umpire indicated that there were to be two at least. Each party obviously was to appoint an arbitrator, and how, then, could the Corporation "concur in the appointment of a sole arbitrator," especially as he was not named? No doubt the case must be referred, but it was not a case for a reference under the contract, but it was a case for an action, to be referred to an official referee, who could raise any question of law and report to the Court on the case. [Lord Coleridge: So there is to be the action, with all its expense, first, and after all it must be referred to arbitration. That seems strange.] Some of these heads of claim are not fit for arbitration at all, and may raise questions of law not fit to be dealt with by a lay arbitrator. Moreover, some of them do not come within the arbitration clause.

Their lordships, having conferred, came to the conclusion that the order ought to be made.

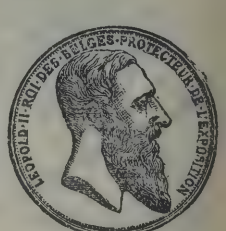
Lord Coleridge, in giving judgment, said he assumed that the arbitration clause was a sufficient submission of future differences, as he thought it clearly was so. Then, as to the effect of the enactment in the Act, he thought that the terms "arbitrator" and "umpire" were used as synonymous. No doubt ordinarily "umpire" meant as between two arbitrators, but not necessarily so, and where there was to be a single arbitrator it excluded an umpire in that sense, and the two words were synonymous. Then there was to be a reference to a single arbitrator, and by the contract, where differences had arisen, they were to be referred to an arbitrator. Now, in this case differences had arisen, and upon application to them to do so the Corporation had not in any sense concurred in the appointment of an arbitrator, as they disputed that it was a case for arbitration at all. In such a case the statute said that either party might give the other notice "to appoint an arbitrator," and if such notice was given and an arbitrator was not appointed in seven days then the Court might appoint one. The letter of the contractor previous to the formal written notice might be taken into consideration, and it ran thus, that he understood the Corporation to dispute that it was a case for arbitration at all, but that if they were prepared to concur in an appointment, then he would submit names to them; and they would not concur in any appointment. That clearly made a case in which the Court had power to interfere and appoint an arbitrator. The Master would, of course, hear the parties on the question of arbitration, and also as to the fitness of any

KALLKOLITH.

NEW PATENT PRIMING AND STAIN.

Acknowledged by experts of nearly every country to be one of the most important inventions of the Nineteenth Century.

PATENTED IN England, Belgium, France, Germany, Italy.



REGISTERED

TRADE MARK.

PATENTED IN Austria-Hungary, Denmark, United States of America.

KALLKOLITH is one of the most marvellous inventions of the present age, and is used as a priming in place of the now almost obsolete oil-colour. It produces an exquisite smoothness, combined with great durability, and amalgamates thoroughly with wood, iron, cement, stone, plastering, &c.

CHEAPNESS.—It saves at least 100 per cent. in comparison with any other priming now in use, being less than half the weight.

ECONOMY is manifested by the fact that one 14-lb. tin of **KALLKOLITH** goes further than three times the same quantity of oil-colour.

DRYING POWERS.—It dries within one to two hours, thereby greatly facilitating the quick dispatch of labour.

DURABILITY.—Where **KALLKOLITH** is used it imparts an amount of durability to all oil-colours used upon it which has never yet been obtained, and one of the most important advantages in its use is that the paint put upon it does not blister.

PAPER-HANGING.—Walls prepared with **KALLKOLITH**, thinned with seven parts of water, give a great additional advantage to the hanging of all descriptions of papers.

TESTIMONIALS.

21 New Bridge Street, London, E.C.: February 23, 1886.

I have had some trials made with the KALLKOLITH during the past few weeks, the results of which are very satisfactory. The KALLKOLITH is to be used as the first coat of paint on wood and other substances, and is of such a nature that the ordinary work in preparing for paint is considerably lessened, and the usual number of given coats now reduced, and, once fairly introduced in the market, I am certain there will be a large sale.

J. WM. STEVENS, Architect and Surveyor.

75 Newman Street, Oxford Street, W.: Feb. 15, 1887.

We are pleased to tell you that the KALLKOLITH supplied to us has been fairly tried, and we find that it answers all that you claim for it.

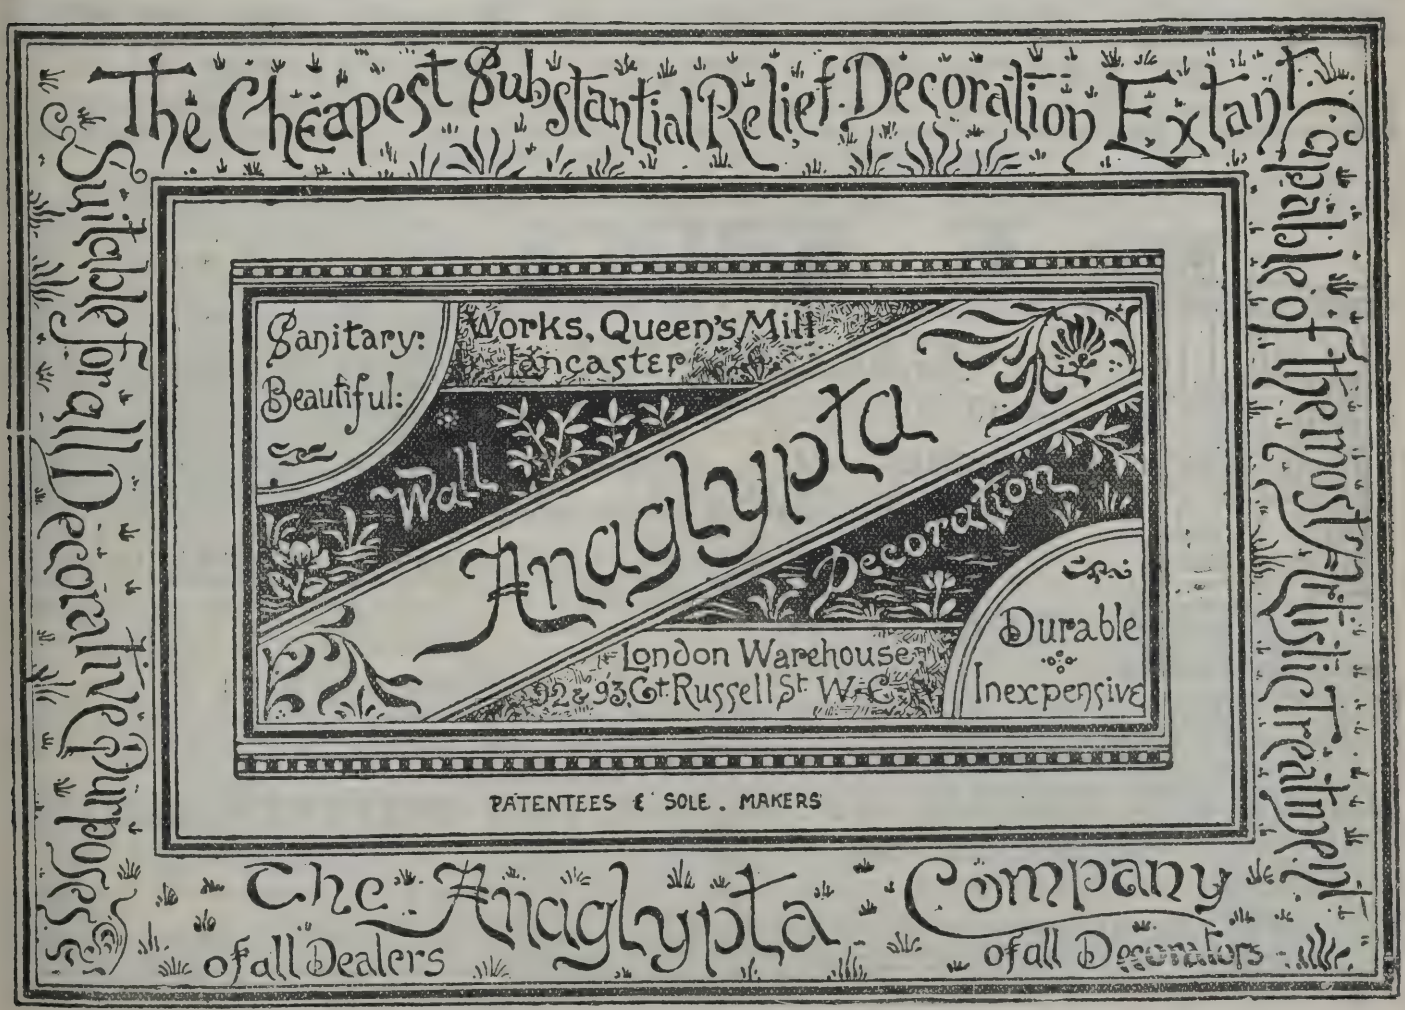
CAMPBELL, SMITH & CO.

Price per case of 8 Tins of 14 lbs. each, net 40s., packing included. Special terms to Wholesale Buyers and Shippers.

Address—KALLKOLITH CO., 175 STRAND, LONDON, W.C.

persons proposed. But the Court could refer the matter to him, and ultimately determine as to both questions. The Court would, therefore, send the matter back to the Master for that purpose, otherwise one of the parties might, by refusing to concur in the appointment of the fittest possible person as arbitrator, defeat the arbitration clause altogether. The appeal, therefore, must be allowed, and the matter go back to the Master.

Mr. Justice Wright concurred, observing that the Corporation could easily ask the Master to appoint a legal arbitrator, and he could easily, if he thought proper, state a case on any point of law. Ordered accordingly. Time to appeal refused.



NEW CATALOGUES.

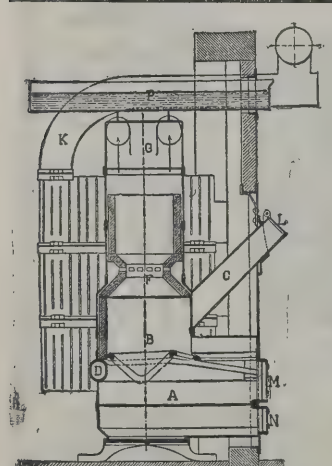
A NEW list has just been issued by Messrs. Robey & Co., of the Globe Works, Lincoln, of the patent "Robey" gas-engine (Richardson & Norris's patent) manufactured by Messrs. Robey & Co. Economy, safety and power are among the leading features of the "Robey" gas-engines. Important improvements have been made in these gas-engines. The principles of construction are as follow:—The firing-slide, which is the cause of so much trouble in other gas-engines, is entirely dispensed with. The valves are of the simplest possible form, and, having but a very slight vertical movement, their wear and tear is reduced to a minimum. No naked light is used; hence there is no risk of the engines stopping through such being accidentally extinguished. There are no stuffing-boxes to pack, no joints to break, or water-jacket to drain when the piston has to be removed for cleaning. The driving-shaft of valve-gear can be taken out without disconnecting a single cam, lever or pin. The engine is so simple that the whole of the parts can be taken to pieces and put together again by any ordinary intelligent labourer without difficulty. The above-named great advantages are possessed by no other gas-engine in the market, and they are of special importance when engines are fixed in situations or in countries where skilled labour is not readily obtainable. Another important improvement is the method of regulating the speed. This method is not only much simplified, but is also thoroughly reliable, so that an engine fitted with Robey & Co.'s patent governor will work with the same slight percentage of variation that their high-class steam-engines do, and thus are well suited for driving dynamos and other machinery direct. A further advantage of Robey & Co.'s governing arrangements is also important. The speed can be readily adjusted to either a low or high velocity, so that the same engine can be set to run slowly during the day for pumping or other purposes, and then adjusted at night to run at a high speed for electric-lighting. The lubrication is excellent, a patent apparatus measuring the lubricant out and feeding it drop by drop when required with perfect uniformity, and automatically ceasing to feed when the engine stops. All the engines are fitted with an improved safety combination, to prevent them starting backward; their working parts are reduced to a minimum, and all the wearing parts have special large surfaces. The whole of the materials and workmanship are of the highest class. With Robey & Co.'s patent regulator the consumption of gas is in strict accordance with the work done, and ceases immediately the engine is stopped. The engines are silent also in working. The list illustrates types A, B, C and D of the "Robey" gas-engines. Type D is especially arranged for electric-lighting; C, for driving pumping machinery, &c.; A, for driving high-speed machinery, &c.; B also is a high-speed engine, and, moreover, meant for electric-light work. Messrs. Robey & Co.'s name is so well known as patentees of high-class steam-engines that this should be a guarantee that any goods manufactured by them would be of the best material and workmanship.

THE HOLBORN EXTENSION.

THE Holborn Extension Committee, which has been formed for the promotion of a new street to the Strand through Lincoln's Inn Fields, and which has offices at 90 Southampton Row, has prepared the following petition of inhabitants of the Holborn division of Finsbury and adjacent districts to the London County Council, which is now in course of signature:—

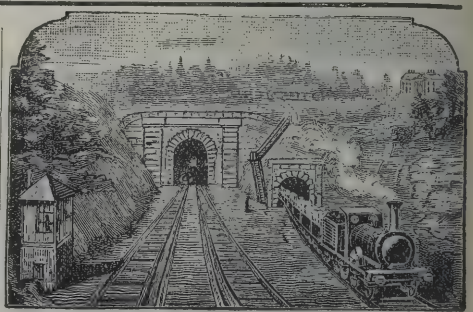
We, the undersigned ratepayers and inhabitants, desire to impress upon you the great necessity of improved communication between Holborn and the Strand. The new street from Southampton Row, which has already been under the consideration of the Council, should no longer be delayed. It is now nearly twenty years since this improvement was mooted, and its necessity has been growing from day to day. Several lines of omnibuses run from Euston, King's Cross and St. Pancras Stations to Victoria, Charing Cross and Waterloo Stations, crossing Holborn; these, with other vehicles, create

almost constant serious blockages. The new Law Courts have also brought considerable increase in the traffic, and great inconvenience is found in getting to the Strand from districts north of Holborn. The bars and gates also which have blocked the way from Camden Town through the division are now taken away, and this has considerably increased the demand for direct communication. We are, therefore, strongly of opinion that this question should not be longer delayed. Many serious accidents have already occurred, and the loss of time caused by the continual blockages at the corners of Southampton Row and Little Queen Street, and also in Holborn, is a very serious matter to the general public. For these and other reasons we urge that immediate attention should be given to this important measure. The route we suggest would commence at Vernon Place, Bloomsbury, and take a course through Kingsgate Street, crossing Holborn, and thence through New Turnstile into Lincoln's Inn Fields, and west of the Law Courts into the Strand, thus opening up the shortest possible thoroughfare through a line of squares and open spaces from the north to the south of London. The recoupment of this route would be so great as to obviate the necessity of the betterment principle being adopted or required, and if economically carried out the cost would not burden the rates to any appreciable extent. At least one-third of the proposed route, namely, the west side of Lincoln's Inn Fields, is already a wide thoroughfare on which no expense need be incurred, and the greater portion of the property which would have to be taken through the whole route is old and dilapidated and of comparatively small value. Your Improvements Committee, having had before it the route *viâ* Little Queen Street, it is necessary to consider if the route we propose would not be both better, but also less expensive, and one that would give greater facilities for relieving the traffic in Holborn and the Strand, and direct access to the Thames Embankment. We respectfully assert, were Lincoln's Inn Fields route carried out, with a spur street starting from the north-east corner of Clare Market in a south-westerly direction to the Strand and Waterloo Bridge, that every facility would be given to persons going both south-east and south-west, and the Council would not only be opening up a communication between the northern and southern railways, but at the same time making one of the greatest improvements ever carried out in the metropolis. One of the principal advantages of this proposed route will be that it will open up an entirely new road from north to south, leaving the existing thoroughfares undisturbed and greatly relieved of traffic.



THE LATE J. E. SMITH.

AN inquiry has been held by Dr. Thomas Jackson, the borough coroner, at 8 Broad Green Avenue, Croydon, into the circumstances attending the death of John Edward Smith, aged sixty-seven years, a retired builder, lately residing at the above address. According to the evidence of the widow it appeared that some time since the deceased had a paralytic seizure which made him very peculiar, and he afterwards suffered from religious mania. He had a building erected at the bottom of his garden in which to study religion, and he recently told witness that he had received a message from Heaven to the effect that they would both live to eighty years of age, and that he would become a great preacher. He went out, and returned looking very unwell. Afterwards he complained of faintness, and before witness could procure him some brandy and milk, which he asked for, he died. Dr. G. Fleming stated than when he met the deceased six months ago he expressed his surprise at seeing him walking without sticks. The deceased replied that he had received a message from Heaven telling him to throw them away, and he had not wanted them since. The cause of death was syncope from heart disease. The jury returned a verdict accordingly.



THE LONDON WATER SUPPLY.

A MEMORANDUM on the water supply of the Metropolis has been prepared by Alfred H. Haggis, Deputy Chairman of the County Council. In the course of it he says:—"In looking forward to the future wants of London and surrounding districts, we may fairly anticipate that the increase of population and consequent demand for water during the next two decades will be at least in equal ratio to the growth of the past twenty years; the probabilities are as to the latter that it will be larger. But I will suppose that the consumption between 1890 and 1910 will increase in the same ratio as from 1870 to 1890, which was nearly 70 per cent. In that case the daily average quantity required in 1910 would be 295 million gallons, an advance of 120 million per day over 1890. Even if the same quantity only was added in the twenty years as in the previous period it would amount to 71 million, or a total of 246 million gallons average per day, to which must be added 10 per cent. for the maximum months. How is this vast quantity to be obtained from

the present sources? The Thames supply has already nearly reached its limit; the maximum allowed to be taken is fixed at 130 million gallons. At the present rate of progress this will be attained in less than five years; it cannot be delayed much longer, even if the ratio of increase be reduced; and yet five out of the eight companies are practically dependent upon this river for their supplies. From the facts supplied by Mr. Binnie, it is evident that the river Lea is already taxed to its full capacity, so that no appreciable assistance can be obtained from it in raising the required quantity, and the supply taken from the springs and wells in the Lea valley during the last three or four years has been augmented 50 per cent., and the increase is still going on. Although the Kent wells may be able to yield an increase on the present supply, yet a great strain has been put upon their resources during recent years; in the comparison between this and last year's supply from the various sources, I showed that the largest increase was from the Kent district, amounting to no less than 12 per cent. in the one year. To sum up, from the Thames there is a margin of 25 million gallons between 105 millions, the maximum already abstracted, and the authorised maximum of 130 millions, whilst from the Lea no additional supply can be obtained, so that the underground water is the only present source available for procuring the remainder of the large quantity estimated to be required by or before the year 1910. It is improbable that the intake from the Thames will be allowed to be enlarged, as the resources of the river will be strained to the utmost to provide the 130 million gallons, and even if there should be sufficient supplies of underground water to make up the deficiency, which is very doubtful, the prejudicial effect upon the wells and streams of the districts of such an enormous abstraction would be so serious that public opinion would probably prevent its being taken. The necessity, therefore, for the provision of a new or supplemental supply on the ground of insufficiency alone, altogether irrespective of the question of purity, would appear to be paramount and urgent. From the statistics I have given it is evident we shall within a few years arrive at a crisis in connection with the water supply of London. Already there is a barely sufficient reserve for the interval that is required for the preparation and carrying out of a scheme for a new supply. I offer no opinion here as to whether it is possible for the supply to be obtained by the construction of storage reservoirs in the watersheds of the present rivers, or whether it will be necessary to secure it from an altogether new source, although all the evidence laid before the Council points to the impracticability of the former course; but in any case a large outlay of capital will be at once required, and this impending and onerous liability must, in the event of purchase by the Council, be taken into account in estimating the value of the Companies' undertakings."

NEW FLOUR MILLS FOR EDINBURGH.

NEW roller flour mills are about to be erected at Chancelot, Ferry Road, Edinburgh, by the Scottish Co-operative Wholesale Society, Limited. Railway sidings will be formed to the mills and warehouse buildings. The whole of the machinery will be of the latest improved type, the flour milling plant being on the roller principle of the most modern description. The plant will have a capacity of manufacturing from 25 to 30 sacks of flour per hour, or between 3,500 and 4,000 per week. On delivery the wheat is to be conveyed into a self-registering automatic weighing-machine, and thence led into separators for the purpose of having the larger impurities removed from the grain. The wheat will next be conveyed into silos with hopper bottoms, having a storage capacity of 21,500 quarters. The main buildings will face Dalmeny Road, having a frontage of 372 feet, and will consist of (1) roller flour mill, 103 feet in height and six storeys high; (2) a large engine-house and electric lighting machinery room, with three wheat-cleaning floors; (3) tower containing wheat pit, millmasters' and sample rooms, continuation portion of wheat-cleaning floors, and a large water-tank; (4) range of silos; and (5) sack-cleaning, repairing and storage lofts. The buildings to the rear are to consist of a warehouse with a storage capacity of 48,000 sacks of flour, the mechanics' shops, a boiler-house, and a chimney-stack 215 feet high. Fronting Dalmeny Road will be the counting-house and a house for resident employés. From the main building a tower will rise to a height of 150 feet with a clock having faces towards four sides. The tower is to contain the above-mentioned tank, which will have a capacity of 75,000 gallons of water for supplying an installation of sprinklers. Throughout the buildings there will be fitted up 2,500 sprinkler-heads connected with about four miles of piping. The sprinkler-heads will be so constructed that, on the temperature rising to 150 deg., water will be discharged, the risk of fire being thus reduced to a minimum. The valves in connection with the sprinklers will be so arranged that, in the event of fire breaking

out, gong alarms indicating the locality will be sounded. Other precautions for the prevention and extinguishing of fire are to be adopted, including steam fire-pumps. The building will be fitted up throughout with electric light. An electric-bell system will also be introduced with the view of communicating between the various parts of the buildings and the engine-room. From the above outline of the mill and buildings there seems to be no doubt that when they are completed and in working order they will be found to be well appointed for the economical manufacture of superior flour. The roller flour milling and other machinery will be erected by Mr. Henry Simon, of Manchester. Mr. James Simpson, Leith, is the architect for the buildings, and the work so far as possible is to be carried out by the society's employés.

THE SANITARY INSTITUTE.

AT the last meeting of the Council the following subjects were decided upon for discussion during the coming session:—"Recent Practice in the Ventilation of Sewers," "Refuse Disposal," and "Working-Class Dwellings." Arrangements have been made for holding a course of lectures for sanitary officers with the County Council of Derby, to be followed by an examination, and similar arrangements are in progress in other centres. Dr. Francis Vacher, M.O.H. for Birkenhead, was elected Fellow, and fifteen members and twenty-eight associates were elected, and a number of applications read for election at next meeting.

REGISTRATION OF PLUMBERS.

THE Mayor of Newcastle-on-Tyne presided over a public meeting held in the Cambridge Hall, Newcastle, in connection with the North of England District Council for the National Registration of Plumbers. Among those present were Alderman Head, Dr. Garnett (Durham College), Dr. V. Rutherford, Councillor Armour and the clerk of the Plumbers' Company, London. Alderman Head, Stockton-on-Tees, remarked on the need for promoting sanitary improvements. The Chairman said no more important subject could enlist the attention of the community, and more especially those responsible for the health of the community, than that which they were there to discuss. They all knew that the plumber's path was different from others. There was so much to do under the boards, under the plaster and underground that really in order to have a good job upon a house they required to have a conscientious man, and experience, skill and adaptation for the work. There was temptation to put as little money underground as possible and to put as much into the front garden as possible in order to sell the house. The temptation was strong. What was the result? Was not the result that their death-rate throughout all their large communities was much larger than it should be? The diseases which come direct from the drains entered their houses with an expense for medical attendance which far outweighed any expense the builder might have put upon the plumbing work. The following resolutions were passed:—"That this meeting memorialise the local authorities to consider the operation of the Technical Education Acts in the counties of Northumberland, Durham, Cumberland, Westmoreland and the North Riding of Yorkshire with reference to technical education of plumbers." "That this meeting, having considered the terms of the resolution passed at the recent Congress of Hygiene on the proposal to organise the training and registration of plumbers, adopt the same and instruct the secretary to send a copy of the resolution to the Members of Parliament of the district and to the President of the Local Board." The meeting concluded with a vote of thanks to the mayor.

Dr. Garnett, Principal of the Durham College of Science, recently delivered a lecture on the subject of "Plumbing and Domestic Sanitation" at a public meeting held in Berwick-on-Tweed under the auspices of the County Council of Northumberland. County Councillor Captain Forbes, R.N., presided, and there was a large attendance, including the Mayor of Berwick, Alderman A. Darling, Mr. Charles Williams, organising secretary of the Technical Education Committee of the County Council, the clerk of the Worshipful Company of Plumbers, &c. Dr. Garnett said that the County Council of Northumberland had taken a high-minded view of its responsibilities in regard to the grant made to it by the Chancellor of the Exchequer, and had resolved to devote the whole sum for the purposes of technical education. Technical education had been defined as instruction in the scientific principles which underlay our trades and handicrafts. He (the lecturer) supposed there was no subject of greater importance than plumbing and domestic sanitation, inasmuch as the life and health of the community depended more perhaps on the study of domestic sanitation than upon any other science, trade, or

handicraft. When the plumber visited a house, assisted by an apprentice only, he performed his own diagnosis of anything that had gone wrong with the sanitation of the house. Then he specified and applied his own remedy. After he had done the work, it was almost impossible to have it efficiently inspected. Thus they trusted their health and property to the plumber. If they placed their property in the hands of a solicitor, the law required that that solicitor should have served so long in the office of a solicitor, and that he should have passed a prescribed examination, and have been registered, while, if he misconducted himself, his name could be struck off the roll. They trusted their lives to an apothecary or a doctor, but the law required that both should have shown their qualification. But in the case of the plumber they had hitherto trusted him with both their health and their property, and had taken his efficiency for granted. It was only when they realised that they entrusted the plumber with interests as great as those which they entrusted to either the physician or the apothecary, that they could appreciate the true value of the plumber, and the necessity for his being properly trained and registered. An interesting discussion followed the lecture, and the meeting terminated with votes of thanks to the lecturer and chairman.

The Mayor of Liverpool, speaking at a public meeting in Liverpool the other day, said the plumbers were an important body, and were as useful in their way for the prevention of disease as doctors were in curing it. He did not wish to take their living from the doctors, but he wished to see the health of Liverpool improved as much as possible, and he thought the best way to do it was to improve the education and scientific skill of the plumbers. Dr. Stopford Taylor, medical officer of health, said a system had been devised, under the title of the National Registration of Plumbers, by the Worshipful Company of Plumbers, by which none but competent plumbers would be registered. There were very strict and searching examinations into the qualifications of applicants, and none but practical and sound workmen were admitted. Since the Registration Committee had been established in Liverpool, 318 applications had been received, and 260 had received certificates of competency. Examinations had also been held of the students in the plumbing classes, and some of the papers sent in by the applicants were so excellent that the Worshipful Company of Plumbers granted prizes and certificates. The Mayor distributed the prizes to the following :—For practical work, J. Bellis and H. Moonsy ; for papers on drains and soil pipes, J. J. Lyons ; for sanitary arrangement of town house, J. Bellis ; for sketch of valve closet, C. Young ; for paper on solders, &c., C. W. Dyke. Certificates were given to D. Cowden, F. R. Bioletti and C. Young for papers on solders, &c. Amongst those present at the meeting were Messrs. W. F. Lawrence, M.P.; C. S. Pain, C.E.; W. Hall, C.E., secretary of the Registration Committee ; Dr. Steeves; Dr. Vachar ; Mr. Edmund Kirby, F.R.I.B.A.; Mr. Joseph Rhodey, president of the Liverpool Lodge of Operative Plumbers; Mr. John Taylor, secretary of the Benevolent Fund; Mr. Levi, chairman of the Liverpool Lodge; Mr. H. Henshaw, A. Bucknell.

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.*]

APPLICATIONS FOR PATENTS.

18884. Frederick Cooke, for "An improved combination dustbin and cinder-sifter."

In the Competition for Gas Engines held by the Society of Arts,

GOLD MEDAL

Awarded to the "GRIFFIN" Gas Engine.

Horizontal Type.

Single-acting Vertical Engine,
From ½ to 4-Horse Power.

CHEAPEST, SIMPLEST, AND MOST ECONOMICAL GAS MOTOR.

SUITABLE AND USED FOR

Hoisting, Sawing, Printing, Pumping, Grinding, Mining, Chaff Cutting, Polishing, Organ Blowing, Sewing Machines, Dairy Work, Boot Making, Pulverising, Soda Water Machinery, &c., &c., &c.,

AND UNEQUALLED FOR ELECTRIC LIGHTING.

Professor JAMIESON, M.I.C.E., F.R.S., Glasgow, in his Scientific Report, says:—

"Throughout the whole of my electrical test the *Engine* WORKED VERY STEADILY; *in fact I have never before tested a Gas Engine which maintained such uniformity of speed* at full power; *no pulsation or blinking being observable in the incandescent lamps.*"

And Professor KENNEDY, F.R.S., M.I.C.E., University College, London:—

"There is no doubt that it is a most important practical advantage of the 'Griffin' type of Engine, that it can be made to accommodate itself to variations of resistance not only without alteration of mean speed, but also without alteration in the number of explosions per minute, and therefore, without any alteration of steadiness."

DRAINAGE WORKS IN MEXICO.

A CONSULAR report upon the trade of the city of Mexico states that the work for the drainage of the valley of Mexico is now being actively pushed forward, and will, it is expected, be concluded within the next three years. It is divided into two parts—a tunnel and a canal, the former about 6¼ miles long, and the latter approximately 30 miles. The tunnel was commenced during the reign of the Emperor Maximilian, by whose engineers the line was run and the levels determined. The Republican Government continued it more or less intermittently until March 1888, when an English firm of contractors (Messrs. Read & Campbell) undertook to complete it within a given time. Since then the contract has undergone various modifications, but as it at present stands the date fixed for its completion is March 1894. In order to admit of work being prosecuted at several points at once, as well as to provide ventilation and means of access, the original scheme comprised also twenty-five shafts at intervals of 437 yards from each other, of which three were subsequently abandoned. The fall of the tunnel is 1 in 1,388, and the shape somewhat remarkable, the upper part being semicircular and the lower egg-shaped. The total inside area is approximately 147 square feet, the height in the centre is 14 feet, and the width in the widest part, where the arch begins about 5 feet from the roof, is 13 feet 6 inches. The invert is built of blocks of Portland cement set on a bed of volcanic stone. The arch is built of four courses of bricks. According to data furnished to the British Consul by the contractors, the following materials are required for each running metre of tunnel:—2,000 bricks, 106 cement blocks, 83 cubic feet of mortar made of equal parts of lime, sand and powdered volcanic stone, 1 barrel of cement, 73 cubic feet of volcanic stone for backing, and 400 feet broad measure of lumber. When the contractors took over the work from the Government, 1,639 yards of the tunnel had been completed, and 2,937 feet in aggregate depth of the shafts, four of the latter being finished down to tunnel level. Since then the contractors have completed and turned over to the Government 2,295 lineal yards of tunnel and 840 feet in depth of shafts (all of which except five are now finished), and there still remain to be done 7,275 yards of tunnel and 329 feet of shaft. When the Government handed over the work, although several of the shafts were nearing completion, there was actually only one available heading for driving, as the four shafts which had been completed were all communicated with each other and with the lower end of the tunnel. Before the work then could be pushed with any rapidity, it was necessary to finish several of the shafts, and it was in doing this that the real difficulty, which lay in the amount of water, became apparent. To give an idea of the amount of water encountered the Consul mentions that on June 30 the quantity of water being raised from the thirteen shafts then in working was 231,000 gallons per hour, and employing eleven 16-inch and three 9-inch pumps, with thirteen steam-engines aggregating 300 horse-power. As the progress of the work depends on the number of headings it is possible to drive at the same time, any accident, however trifling, which stops the pumping in any shaft for a few hours brings with it serious consequences, as work is perforce suspended on the two headings drained from it owing to the rapid rise of water. Moreover, the difficulty of repairing breakages quickly is much enhanced by the size of the pumps and the

"SPHINX" PORTLAND CEMENT

112 lbs. per bushel. Slow setting; test 1,000 lbs. to 1½ inch; seven days. Fineness, 2,500 meshes to square inch, with less than 10 per cent. residue. Over 10,000 tons supplied to Cardiff and Hereford Water Works.

Specially adapted for Concrete Floors and Street Paving.

"ECLIPSE" PORTLAND CEMENT

Quick setting; test, 3 parts. Standard Testing Sand, 230 lbs. per square inch; 28 days. The finest, most plastic, best sand carrying, and cheapest Cement in the market. Specially adapted for laying encaustic tiles, making joints in sanitary pipes, internal stucco, concrete foundations, &c.

ANCASTER, NEAR GRANTHAM.

very small dimensions of the shafts. In spite of these and other difficulties, not the least of which have been the training of the workmen and the necessity for constant supervision over so many isolated points, the work is now progressing satisfactorily. Thirteen shafts with their corresponding headings are now being regularly worked, and the machinery for the remaining four is in position. Seven miles of the canal have already been completed.

BUILDING AND BUILDERS.

AT the meeting of the Plans Committee of the Aberdeen Town Council, it was agreed to approve of the plans for the proposed addition to the railway company's Palace Hotel. The extension will consist of an additional storey, and the estimated cost is upwards of £1,000.

IT is intended to build a new Congregational chapel at Rochdale, to take the place of Providence Chapel, which was discovered to be unsafe some months since. The cost of the new building will be £5,000.

PLANS for the Hutchesontown new church have been sanctioned. The architect is Mr. John B. Wilson, A.R.I.B.A. and I.A., whose design was selected by Mr. William Leiper, president of the Institute of Architects, from those submitted in competition by a selected number of architects.

THE annual meeting of the members of the Bolton Master Builders' Association was held last week, Mr. William Townson presiding, in the unavoidable absence of Mr. William Bryce, president of the Association. The annual report stated the past year has been one in which there has been an increased amount of trade, but at prices still too low. A number of questions have arisen between the employers and operatives with regard to alteration of rules and wages. The report concluded by speaking of the benefits of the Association, and pointing out that it had secured satisfactory settlements of disputes, and pleaded for a full recognition on both sides of fully signed agreements. Mr. Bryce was re-elected president for the ensuing year.

THE *South Eastern Gazette* says:—A conference arranged by the Maidstone, Chatham, Rochester and Strood Master Builders' Association was held recently at the Mitre Hotel, Maidstone, for the purpose of discussing and, if possible, agreeing upon a form of contract that should be more equitable and acceptable than that generally in use in the county, and for discussing other matters of interest in connection with the building trade. There was a large and representative meeting of the principal architects and builders of the county of Kent, upwards of forty being present, and the chair was taken by Mr. G. E. Wallis, the vice-chairman being Mr. Callund, of Rochester. Several resolutions in accordance with the objects of the meeting were unanimously agreed to, and it was arranged to supply, as soon as possible, all architects, surveyors and builders in the county with a copy of the same for adoption in the future.

A MEETING of carpenters, joiners, bricklayers and plasterers has been held at Colchester to consider the best way to improve their condition in the town. A code of rules which had been drawn up by a committee was adopted.

THE preparations for the Isle of Man International Exhibition, to be held next summer at Belle Vue, Douglas, are being rapidly pushed forward. The plans and specifications of the intended buildings have been prepared, and tenders invited for their erection.

THE annual meeting of the Birmingham Master Builders' Association has just been held. Mr. C. H. Barnsley, president, occupied the chair, and there were also present Messrs. J. J. Moffatt, J. Whittall, R. Bulley, G. Twigg, T. Surman, W. Sapcote, J. Bowen, J. Webb, G. Raby, and E. J. Bigwood, secretary. The committee's report stated that during the year builders had been fairly well employed. At the commencement of the year notices were received from the plumbers and the general labourers asking for an advance of ½*d.* per hour, and for the signing of working rules. In the case of the plumbers a set of rules was signed, giving an advance of ½*d.* per hour from April 1, 1891, making the ordinary rate of wages 9*d.* per hour. As to the labourers, a code of rules was agreed upon, the wages being settled at 5½*d.* per hour. Notices asking for an advance of ½*d.* per hour and alterations in the rules had just been received from the bricklayers and labourers, and would receive the careful consideration of the committee.

THE naval authorities at Devonport propose the construction of several supplementary buildings in connection with the naval barracks at Keyham. It has been decided to commence at once the building of drying rooms and skittle and bowling alleys, but the enlargement of the main buildings will not be begun during the present financial year. It has, however, been practically decided to build another large block for seamen and stokers, and a second block for the accommodation of officers.

TRADE NOTES.

A NEW public-hall has been erected at Newport, which has been ventilated by the "Climax" direct-acting chimney terminal ventilators, designed to harmonise with the architectural features of the building. These ventilators were supplied and fixed by the "Climax" Ventilating Company, 15 Great George Street, Westminster.

THE new schools, Wilmslow, are being warmed and ventilated throughout by means of Shorland's patent Manchester grates, the same being supplied by Mr. E. H. Shorland, of Manchester.

THE Colonial College, Hollesley Bay, is being warmed by patent warm air ventilating firegrates, supplied by the patentee and maker, Mr. John Grundy, London, and Tyldesley, near Manchester.

THE patent "Grahtryx" self-acting exhaust roof ventilators of Messrs. Baird, Thompson & Co., of London and Glasgow, are being used for the ventilation of the new Catholic schools, Cardiff.

A LARGE clock has just been erected in the parish church at Tilney All Saints, Norfolk, which plays the Westminster quarter chimes, strikes the hours upon a large bell, and shows time on one dial. It has been manufactured by Messrs. John Smith & Sons, Midland Clock Works, Derby, to the designs of Lord Grimthorpe, and it is guaranteed by the makers to keep accurate time. The same firm are also now making other similar clocks for Aston Cross, Birmingham, and Little Wenlock.

"C. CARR'S," Smethwick, have secured the contract to rehang the magnificent old peal of bells (tenor 1-ton weight) at St. Thomas's Church, Stourbridge, in competition with all the leading firms of bellfounders in the country.

THE contract for the drainage of Flamborough has been let to Mr. Robinson, of Hull, for £1,700, Mr. Dyer, of Bridlington Quay, being the engineer. The total cost of the drainage and connections will be about £3,000.

THE Secretary of State for Foreign Affairs has been informed by Her Majesty's Consul at Corunna that tenders will be received at the offices of the Minister for Public Affairs at Madrid, up to the 16th of December, for deepening the Villaviciosa River, in the Province of Asturias, at an estimated cost of 1,118,564.98 pesetas, equal to about 44,742*l*. The tenders will be opened on the 21st of that month. Conditions, plans and estimates may be seen at the General Office of Public Works, Madrid, and at the Public Works Departm of Oviedo, in the Province of Asturias, where tenders may also be presented.

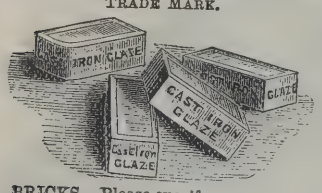
AN installation of the electric light at Felsted School has just been completed. This is the first public school in the country to be so lighted.

WE desire to draw attention to the advertisement of a sale which is to be held by Messrs. Horne, Sons & Eversfield, in December 1891, when the structures in the Naval Exhibition, which were recognised as possessing exceptional interest, will be disposed of. It might be said that what is sold will never cease to have importance with the public.

THE little church of St. Paul's, Highwood, Writtle, has been reopened after restoration, and new benches have been put in. The flooring is entirely new, and new windows of leaded cathedral glass have taken the place of the old ones. The edifice has been heated throughout on Grundy's principle. Messrs. Choat & Son, builders, of Chelmsford, carried out the work.

VARIETIES.

IT is announced that the Royal Commission for the Chicago Exhibition, 1893, are now prepared to receive applications for space in the British Section. Such applications are to be made upon forms which may be obtained at the offices of the Society of Arts, London, where also information can be procured as to the condition of the exhibition, the charges to be paid for space, &c.



AN inquiry has been held into the application of the Horbury Local Board for sanction to borrow a sum of 13,000*l*. for sewerage and sewage disposal. The details of the scheme were explained by Mr. S. Shaw, of Dewsbury, the engineer.

THE Halifax Town Council have decided to make application to the Board of Trade for a provisional order authorising the Corporation to supply electricity for public and private purposes within the borough.

IT is proposed to erect a memorial to the late Mr. Barry Sullivan, at his grave in Glasnevin Cemetery, Dublin.

AN application has been made by Mr. James Young, railway contractor, Caerleon, Bearsden, for permission to place a window in the parish church, New Kilpatrick, in memory of his father.

THE gold chain of office of the Mayor of Oswestry, started by Mr. W. H. Spaull, architect, during his mayoralty, has been completed by Mr. Wynne Corrie. Mr. Spaull attached one link to it, leaving his successors to supply one link annually. The links consisted of square tablets of heavy gold filigree work, the remainder of the chain being formed of blue ribbon. Mr. Corrie has now had a heavy gold border placed around each link, and he has completed the chain, the links being connected together by means of twisted serpents.

AT the meeting of the Association of Birmingham Students of the Institution of Civil Engineers, held at the Midland Institute, Birmingham, the president, Mr. J. Edward Wilcox, in the chair, a paper was read by Mr. J. D. Twinberrow, student, on "English and American Rolling Stock."

MORE money is required for the water supply at Crediton, and, in addition to the 2,000*l.* for this purpose, another 1,000*l.* is to be asked for to provide public offices. A Local Government inquiry will be held on the 28th inst.

THE inquiry opened at Birkdale into the application of the Local Board for permission to borrow 18,960*l.* for works of sewage disposal and surface drainage has been adjourned.

AT a recent meeting of the Wetherby Sanitary Authority, Mr. Preston, engineer, attended and laid on the table plans for the proposed new drainage scheme for that place, showing the depths and gradients and the diameters of the pipes to be used. The cost will be about 5,000*l.*

THE Manchester Ship Canal Company are about to apply to Parliament for powers to acquire additional lands, for an extension of time for the construction of the Warrington dock, and for other purposes.

AT Rawmarsh an inquiry was held in reference to an application made by the Local Board for permission to borrow 2,000*l.* for providing public offices. The estimated cost of the proposed offices was 2,187*l.*

THE Government have decided to undertake the drainage of Cairo. For this purpose they invite engineers and others to send in plans. These will be received by the Public Works Ministry up to January 31. A commission composed of an Englishman, a Frenchman and a German will be appointed, and they will be empowered to select the best scheme which is presented or to adopt one of their own making. The author of the scheme approved of is to receive a premium of 200*l.* The smallness of this sum and the short time allowed for a work of such magnitude will probably restrict the competition. Mr. Baldwin Latham two years ago furnished the Government with a complete plan and an estimate of its cost, but French opposition stands in the way of its adoption.

THE Gloucester City Council have agreed to the appointment of a committee to consider the desirability of the Council acquiring the City Gasworks.

THE development of the coalfields of West Yorkshire is just now said to be proceeding at a rate hitherto unequalled. It is expected that within the next three years the West Riding will be able to turn out at the rate of not less than 30,000,000 tons of coal annually.

THE *Liverpool Courier* says:—There has been formed in Liverpool a company called the Overhead Railway, whose primary object is to carry a railway line on stilts along the margin of the docks. It has been a long time in course of construction and still appears to be a long way from completion. There is some vague hope that it will be opened for traffic in May next. Until it is completed and in working order it is impossible to determine what will be its true character—whether a public convenience or a public nuisance.

THE new theatre in St. Martin's Lane, which is now ready for roofing in, is to be known as the "Trafalgar."

A SECOND Eiffel tower for France is proposed to be constructed at Fouvières. The foundations, base and masonry work will be carried out by a Lyons firm of contractors.

AT a special meeting of the Birmingham City Council this week the draft of a Bill empowering the Corporation to obtain a supply of water from the rivers Elan and Claerwen, in Wales, was considered. Sir Thomas Martineau, in proposing the approval of the Bill, explained that authorisation was given for borrowing 6,600,000*l.* This amount was necessary in order to meet the requirements of the next fifty years. The first instalment of works was estimated to cost 3,340,000*l.* The Bill was approved, and it was decided to call a town's meeting to obtain the sanction of the ratepayers.

THE Oldbury Local Board some time since invited applications from engineering experts with regard to laying down an improved system of sewage disposal at their outfall works. The population of Oldbury is about 20,500, and the average daily flow of sewage is computed at 500,000 gallons. Three engineers were selected to submit schemes to be sent in under motto. At the last meeting of the Local Board the Sewerage Committee recommended that the scheme marked "Forward" should be

VENTILATION.

Special Notice to Architects.

Rd. No. 9.

Rd. No. 6a.

Gentlemen,—As a proof of the confidence we place in our GIBBS' PATENT WEATHER-PROOF AIR EXTRACTORS, we hereby offer to send at our sole risk to any Architect in the United Kingdom (upon being furnished with satisfactory references) one of our ordinary "Extractors" for competition and comparison with other Ventilators by any maker. If ours is not found superior in every respect, the same to be returned (say, within fourteen days) at our risk and cost; if retained to be paid for at usual rates.

Yours Obediently,

JOHN GIBBS & SON,

Warming, Ventilating and Consulting Engineers,

27 SOUTH JOHN STREET, LIVERPOOL.

HYGIENIC WORKS— LIVERPOOL. | TELEPHONE— No. 1,389. | TELEGRAMS— "VENTILATION, LIVERPOOL."

From the prevailing tendency on the part of unscrupulous advertisers to push the sale of utterly inferior ventilators made of the lightest materials and flimsiest possible construction, we find it advisable to make the foregoing offer. All we desire is fair comparison in quality and price.

adopted, that schemes marked "A 1, A 2 and A 3" should receive the second prize, and that the scheme marked "Practical" be awarded the third prize. The report of the committee was unanimously adopted. The author of the selected scheme is Mr. H. Bertram Nichols, C.E., of Birmingham. The system proposed is that known as the "International Process." The existing works and land will be utilised as far as possible, the present tanks being altered in construction to adapt them to the new process. The sludge will be pressed into cakes, the necessary buildings and machinery being provided in the scheme. The cost is estimated at about 6,000*l*.

IN the forthcoming session of Parliament the North-Eastern Railway Company intend seeking powers enabling them to make additions and alterations at various places on their system. The most important project is the making of a lock near Hedon Road, Hull, with an entrance from the river Humber, containing 32 acres. It will be 800 yards long and 200 yards wide, and will therefore be an important addition to the accommodation for shipping already provided at this port.

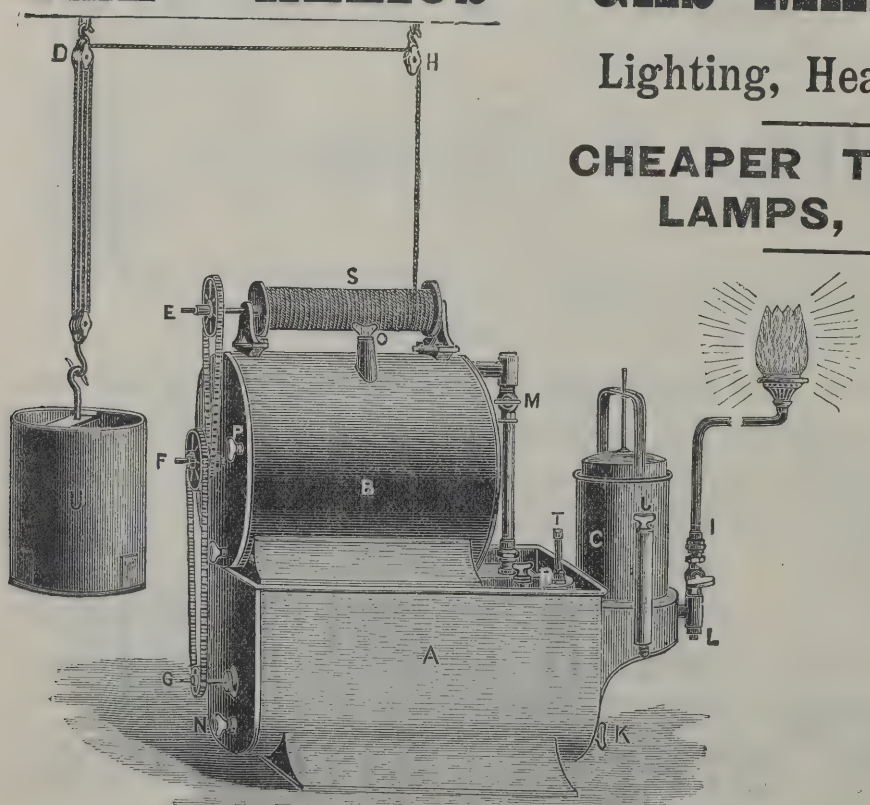
A BRONZE statue has been erected at Barrow-in-Furness in memory of the late Mr. Henry William Schneider, who was connected with the town from the time when it was a mere fishing hamlet, and had much to do with bringing about its present position of commercial and industrial prosperity. Mr. Schneider discovered the valuable iron ore deposits at Park, situate in the borough of Barrow. These mines are still in active operation, and since they were opened 10,000,000 tons of ore have been raised and about £600,000 paid in royalty. Subsequently Mr. Schneider, in company with the late Mr. Robert Hannay, commenced blast furnaces at Barrow for smelting the ore, and later on the Barrow Steel Works were started. These works are amongst the largest of their kind.

A SKETCH of the Gateway Chapel at Worksop Abbey, by Mr. Burke-Downing, A.R.I.B.A., appears in the *Daily Graphic* of Saturday, the 21st inst.

MR. W. LLOYD WISE, county councillor for the Southend Division of Essex, and member of the Kent and Essex Sea Fisheries Committee, has addressed a letter as follows to the Secretary of the London Chamber of Commerce:—"I feel constrained to resign my membership of the London Chamber of Commerce. I do so with much regret, as a protest against the proposed attempt to influence public opinion and the legislature on the Thames Sewage question, by means of a committee professedly representative, but on which (although special representatives have been put on for other places, including one for South-East Essex, with the latter of whom I am in complete accord) the rapidly increasing town of Southend, which is so peculiarly and vitally interested in this all-important question, has been expressly denied a special representative, and the whole question is being treated as one affecting the upper portion rather than the mouth of the river—thus ignoring especial injury to Southend and other important places near the river's mouth, not only such as already suffered, but also involved in different schemes proposed."

THE Christmas number of the *Gentlewoman* contains a beautiful art picture on fine satin panel as a supplement, realising Tennyson's well-known lines, "Her eyes are homes of silent prayer." The face portrayed is charming, and the careful way in which it is printed lends an extra charm to the whole thing. The number is full of interesting tales by some of the best authors. A novel idea is the opening chapter of a new tale which will appear week by week, each chapter being written by some well-known writer of fiction, entitled "The Fate of Fenella."

STRUTTING BUILDINGS IN MANCHESTER.



AN application was recently made in the Chancery of Lancashire for an injunction against the Lever Strutt Building Society in respect of trespass on the land belonging to trustees of Richard Higham. In 1872 he built some houses upon land which he owned in Queen's Road, Cheetham. The houses were five storeys high and the land sloped very considerably. The defendants were mortgagees of certain property on the other side of the plaintiffs' passage, and they asked permission to place strutts between the two sets of buildings. When the plaintiffs' houses were built there had been a serious settlement, and they were not unnaturally afraid to allow any extra weight to come upon their buildings. Permission to erect the strutts was declined, but in July 1890 the defendants took "French leave" and erected fifteen strutts. Subsequently they made a hole in the plaintiffs' passage and put in the concrete foundation complained of. The trespass in respect of which the injunction was sought was comprised under four heads—first, the erection of strutts by which it was calculated considerable pressure would be caused to the plaintiffs' buildings; secondly, the knocking down of a wall which belonged to the plaintiffs; thirdly, the making of a hole in the plaintiffs' passage; and

THE "HELIOS" GAS-MAKING MACHINE

FOR

Lighting, Heating, and Motive Power.

CHEAPER THAN COAL GAS, OIL LAMPS, OR ELECTRICITY.

This Machine is the latest development of the Oil Gas systems. In most other such machines Gasoline is the gas-producing material, and as this can only be procured in large quantities, and is dangerous to store, there is naturally a great objection to its employment. The "Helios" Gas Machine is charged with Benzoline, which can be procured anywhere in large or small quantities. The Machine is simple, and the light produced far superior to coal gas. Machines made to supply from 6 to 2,000 lights.

Prices from £10 10s.

UNEQUALLED FOR

COUNTRY HOUSES, FACTORIES, HOTELS, &c.

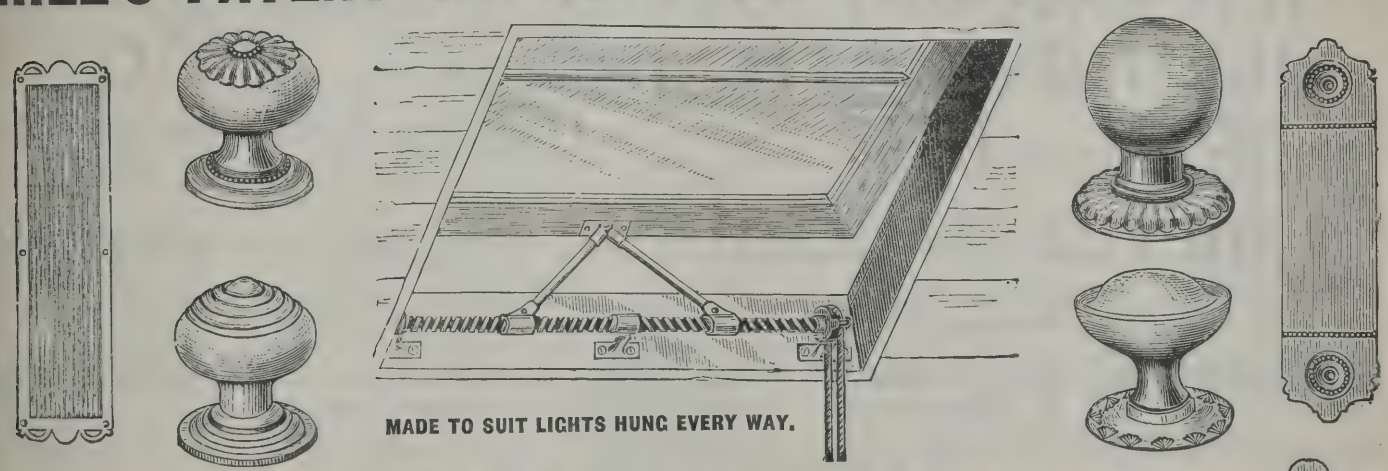
THE INCANDESCENT GAS LIGHT CO., LIM.

14 PALMER STREET, WESTMINSTER, LONDON.



fourthly, and this was the most important matter, the taking for the defendants' own convenience, and to avoid spending money, part of the plaintiffs' land for the purpose of forming a foundation for their own wall. In regard to the last-mentioned head, the defendants had encroached under the plaintiffs' wall, and to the extent of 2 feet into their passage, for the purpose of making the cement foundation. One result of that would be that if such concrete work were allowed to remain for the period of twenty years, the defendants would have established an easement which would prevent the plaintiffs from dealing with the passage as they chose. In their pleadings the defendants admitted that they had placed the concrete under the wall and passage, and had paid 40*s.* into court in respect of damage caused thereby. Counsel read a long correspondence which took place, and said that the defendants pleaded that they were ordered to do the work by the City Surveyor, and they characterised the action as unneighbourly and frivolous, and demanded that the plaintiffs should consent to its being dismissed. Counsel for defendants said the act complained of with reference to the concrete was not a continuing act. He was not seeking to justify the concrete being there permanently. It could easily be removed. The Vice-Chancellor said he must protest most earnestly against the theory that, in a great city like Manchester, where the rights of supports to property were very valuable indeed, any person could go and make a hole in his neighbour's property and then say he justified it by the payment of 40*s.* into court.

Eventually, terms were agreed upon for a settlement of the case.

BRITISH IRON TRADE ASSOCIATION.

A MEETING of the board of management of the Iron Trade Association was held on the 13th inst. in London, under the presidency of Mr. W. S. Caine. The meeting considered the question of whether any evidence should be offered before Group A of the Royal Commission of Labour, and decided that such evidence should be submitted as would enable a comparison to be made of the differences that distinguish the conditions of labour in this and other ironmaking countries as regards the rates of wages and actual earnings of labour, the hours of employment, the regularity of employment, the comparative efficiency of labour in reference to the results realised for a given amount of wages, the extent and effect of juvenile and female labour, the extent to which accidents occur and the comparative liability thereto, and other matters on which a comparison is possible. A *précis* of the evidence so to be submitted was considered and adopted, subject to further examination and revision, and it was decided that in submitting such *précis* the secretary of the association, Mr. J. S. Jeans, should give oral evidence if that should be deemed desirable. The secretary submitted a memorandum as to the provisional order bills of the railway companies which received the Royal assent on August 5 last. The decision of the joint committee of Lords and Commons to remove about nine-tenths of the iron and steel manufactures produced by the members of the association from Class B, where it had been placed on the Board of Trade classification, to Class C, was stated to be very unfortunate for the trade, inasmuch as it would entail the payment of maximum rates, varying from 40 to 50 per cent. higher than would have been payable if the Board of Trade classification had been allowed to stand. Besides this, the manufactured iron trade would now require to pay an increased station terminal of a shilling, including both ends, and service terminals to the amount of 8*d.*, where no service terminals were required under Class B. The provision as to sidings, which was of the utmost importance to the iron trade, left the companies at liberty to make special charges for their use, if the amount is fixed by an agreement in writing, signed by the trader, "or determined, in case of difference, by an arbitrator appointed by the Board of Trade." The memorandum was received, and it was resolved that it should be printed and circulated among the members of the trade. Mr. Bleckly, of Warrington, brought forward the subject of the decision given by Mr. Justice Chitty, in which he held that as the word "Britannia," used in connection with the manufacture of soap, was a geographical expression, it was not capable of being registered and was accordingly ordered to be removed from the register. The Board held that this was a decision of great importance to the iron trade, as many firms use geographical expressions as trade marks, and directed further inquiry to be made as to the effect of Mr. Justice Chitty's decision on such marks. The Board resolved to take steps for the issue of a periodical bulletin of statistical information relating to the production, import and export of iron and steel in different countries, and matters of cognate interest. A letter was read from the secretary to the London Chamber of Commerce requesting the Board to co-operate in the work of the mining section lately formed in connection with that Chamber.

PORTLAND CEMENT.

AT the second ordinary meeting of the Institution of Civil Engineers three papers were read relating to Portland cement and Portland-cement concrete. The first was "Portland Cement; its Manufacture, Use and Testing," by Mr. Henry Kelway Bamber, F.I.C. The author gave analyses of the most suitable clays and chalk to be used in the manufacture of Portland cement, and described the process of preparing and mixing these ingredients, drying the resulting slurry, and of burning. The average composition of good cement was indicated. In these operations care and constant chemical testing were necessary to keep the ingredients in proper proportion, so as to insure the regular percentage of each in the finished cement. Reference was made to the packing in the kilns of the dried material in lumps of a size not too large to prevent the heat from being evenly distributed through the entire kiln, otherwise there would be a large proportion of insufficiently burned and unclinkered produce. In clinkering, the material entered into semi-fusion only, and it was during this process that the properties of good cement were produced. Given therefore proper proportions of ingredients and proper burning, so as to obtain good clinkers, the result would be good cement. This had next to be ground to fine powder and sifted, so that all should pass through a sieve of 2,500 meshes to the square inch, and not less than 90 per cent. should pass through a sieve of 5,625 meshes to the square inch. The finer the cement the more easily was it thoroughly mixed with water, which insured its proper setting without the chance of blowing afterwards. About forty pounds of water should always be used to every cubic foot of cement. This would insure that every portion of cement should have the full quantity it could combine with, and if this were done no blowing could take place, because blowing was caused by portions of cement taking up water and expanding after the body of the cement was set. The author made experiments three years since with concrete composed of four parts of shingle, two of sharp sand and one of cement. These were mixed in duplicates, the first lot with the full quantity of water it could take and the others with only half that quantity of water. These blocks after twenty-four hours were put on a wall and were covered twice every day for twelve months by the tide. At the end of the year they were cut through the centre. Those made with the full quantity of water were sound, hard and perfectly dry all through; those made with half the quantity of water were wet through and easily broken to pieces. As there was no difference in any of the ingredients except the quantity of water used, this showed that for concrete to set properly and satisfactorily it must at the outset have the full quantity of water mixed with it. These blocks were made with new cement a day or two old, showing that new cement was perfectly safe if mixed in proper proportions. In the ordinary course cement would be about a month old when used, and there was no advantage in keeping it longer, for it began to lose its power of combining with water, an old cement not being able to absorb and combine with nearly so much water as new cement. In newly-ground good cement the particles were in such a molecular state as to quickly combine with water, forming a hard permanent crystallised solid. By age there was evidently a molecular change gradually taking place, for after a time the cement, although not exposed to the air, lost its power of setting when mixed with water, although the percentage composition might be exactly the same. The author then described the best test to determine if the cement were good:—First, there should be a chemical analysis to show the proportions in which each constituent existed, but as this in itself was not sufficient to show if the cement had been fully clinkered, he recommended the taking of the specific gravity, which should not be less than 3·10 to 3·15 at the end of a month. This was much more reliable than the ordinary use of the striked bushel, which varied considerably, according to the way in which the vessel was filled. Then ensued the mixing of the cement with water, and the forming into briquettes to test the breaking-strain at 7, 14 and 28 days; the quantity of water in these briquettes varied with each manipulator, the general desire being to use as little water as possible. The author thought, however, that it should be stipulated how much water should be used in making the briquettes, when the results with the same cement would be more uniform, for a cement that could not take up its full quantity of water, 20 per cent. to 25 per cent. of its weight, was not as good as one that could do so, other things being equal. A good cement, not too old, would expand in setting and completely fill the space allotted to it, whereas an old cement would not do so, and consequently spaces would be left for water to enter and weaken it.

The second paper, by Mr. Alfred E. Carey, M.Inst.C.E., was entitled "The Inspection of Portland Cement for Public Works." The author emphasised the following points:—Uniformity of the raw materials; completeness of the mechanical blending of the raw materials; the proportion of carbonate of

lime; the thoroughness of the wet-grinding; the burning; the flouring; the aëration and packing of the finished cement. Particulars were given of the chemical analysis of various clays in use, and it was pointed out that the hydraulic factors were the silica and alumina, with iron, and that the highest standard of quality was probably attained when the ratio between these was

$$\frac{\text{lime}}{\text{hydraulic factors}} = 2.$$

The various processes for the mechanical blending of the raw materials were described, and special stress was laid upon constant chemical testing at this stage of manufacture, and also on the thoroughness of the blending in a wet state. In regard to burning clinker, the author traced the various chemical changes which took place and the corresponding temperatures. He considered that a temperature of about 2,900 degs. Fahr. maintained for a short time only was the most favourable for producing high-class clinker. He described the more recent systems of burning cement, giving details of the Ransome and Joy processes, and advocated the adoption of the test by specific gravity instead of by weight per bushel. He proposed for this standard 3·1; a high specific gravity, combined with extreme fineness, being one of the surest means of proving that a given sample of cement was well burnt. In respect of fine grinding, it was pointed out that it was the flour or impalpable powder which formed the effective part, the nibs or coarse residue forming an adulterant similar to the admixture of a corresponding proportion of sand. This was proved by a series of experiments, in which the residues, on a succession of sieves, were removed from a given sample of cement, when the tensile strains were proportionately increased. The question of the dry-grinding and the temperature of cement, as it left ordinary mill-stones and edge-runners respectively, was then referred to. The author considered aëration essential with cement as now usually manufactured. With regard to packing, the want of a less expensive and more efficient packing-case than the ordinary cement-barrel was mentioned. The author suggested that for foreign works clinker might sometimes be conveniently exported and ground on the spot. As to the question of testing, he considered that a test of ½-inch × ½-inch section would in some cases be a useful guide, and described the various apparatus now in use for the purpose of compression-testing, calcimeter-testing, taking specific gravity, &c. On the question of standard regulations, the rapid progress which had been achieved in quality in England, despite the absence of any Government tests, was pointed out, and it was stated that had such a standard been formulated ten years ago, its effect would probably have been retrograde. The practice of foreign governments and societies as to standard tests was detailed, and a specification was given applicable to the present stage of cement production. Minute particulars of the various points to be noted in gauging briquettes were given and the subject of the adulteration of cement was dealt with. The author did not believe adulteration was much practised in this country, although the Society of German Cement-manufacturers had thought it desirable to formulate special rules on the subject as regarded Germany. In dealing with the use of cement, the author stated that in his opinion cement and concrete were likely to take the place in many respects of iron and timber as now applied. He also gave particulars of a series of experiments carried out by Mr. Joseph Cash, M.Inst.C.E., at his request, in order to test the power of Portland cement to resist long-continued hydrostatic pressure. These tests were made with concrete of varying proportions, and a further series was carried out to ascertain the extent of the penetration of cement on the surface of a mass of rough concrete. Another series dealt with the question of the extent to which rough concrete would prevent filtration. The efficacy of rendering a surface of concrete in connection with hydrostatic pressure was also discussed. The quantity and purity of water for concrete-making was referred to, the author detailing the results of the admixture of fine river-mud of varying proportions on the strength of concrete blocks. The effect of the presence of sulphuric acid as observed by experiment was given, as also the effect of frost upon cement briquettes and *per contra* of high temperatures such as prevail under tropical conditions. The effect of sea-water on the maturing of concrete was dealt with, the author considering that when gauged with sea-water concrete matured more rapidly and passed more quickly into the crystalline condition than when gauged with fresh water. The limits within which concrete might be safely applied, more especially on works in the sea, were defined, it being shown that two distinct issues had to be considered in dealing with this much-debated subject:—1. The influence of magnesia as an ingredient in the manufacture of cement. 2. The alleged deterioration of sound cement when subjected to the action of sea-water. He showed that caustic lime or caustic magnesia were both harmful in cement, but that a high percentage of magnesia, when clinker was well burnt, was not necessarily deleterious. In dealing

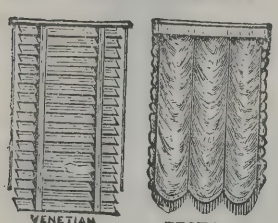
with the second branch of the subject, the author pointed out the desirability of Portland cement not containing more than 4 or 5 per cent. of magnesia, because this material was really an adulterant and not actively useful. He detailed particulars of a series of experiments with cement-sand briquettes of varying proportions which had been exposed to long-continued tidal action without harmful effects, and gave the increase in the weight of these briquettes. He also referred to a series of tests with fresh water, varying proportions of fresh and sea-water and sea-water partially evaporated, it being pointed out that in situations in which ammonia might be brought into contact with concrete it was desirable to use fresh water for gauging, and to exclude cement containing any considerable proportion of magnesia. The author's opinion was, however, that no conclusive evidence had been adduced to prove that the precipitates from sea-water induced disintegration of even fissured or porous concrete when sound cement was used. In conclusion, the author referred to the chemical and physical transformations of Portland cement in setting and the general chemical conditions under which Portland cement of the highest class was obtained.

The third paper read was on "The Influence of Sea-water on Portland Cement Mortar and Concrete," by Mr. William Smith, M.Inst.C.E., of Aberdeen. In the course of a discussion which took place at the Institution in the year 1886, the author, who was the engineer of Aberdeen Harbour, had stated that since the construction of the south breakwater at that place in 1872 he had noticed "the disintegration of the surface of the concrete by the chemical action of the salt water on the Portland cement." The softening and swelling of the concrete wing-walls at the entrance of the graving-dock induced him in the following year to refer the matter to the late Professor Brazier, of Aberdeen University, for a thorough investigation of the chemical reaction causing disintegration. In June 1887, that gentleman gave his opinion that the analyses of the series of decomposed cements (concrete) showed a remarkable difference in composition from the original cement, inasmuch as in all the samples submitted to him there was found a large quantity of magnesia, and a large proportion of the lime was in the form of carbonate. He believed that this alteration was brought about entirely by the action of sea-water upon the cement. There was no other source for either the magnesia or the carbonic acid. The author then reported that "the rapidity of the chemical action was due to the unbalanced pressure of the water on the wing-wall" when the dock was emptied. This caused a current of sea-water through the porous structure of concrete, which continually washed the decomposed cement into the dock, and brought new particles of concrete into contact with the sea-water. In July 1887, Mr. P. J. Messent, M.Inst.C.E., was requested to make an independent investigation of the cause of the deterioration of the concrete, and in the following November issued a report confirming the results obtained by the author and Professor Brazier, by experiments at the Tyne piers and by additional analyses of the disintegrated concretes by Mr. Pattinson, the public analyst for Newcastle-on-Tyne. From a series of experiments and investigations by Professor Brazier and himself, the author inferred the cause of the expansion of concrete, subject to the influence of sea-water, to be the formation of a more bulky compound of magnesia and lime with carbonic acid, and especially with sulphuric acid and water, in place of the lime of the cement. The chemical equations for the action of the lime in the cement upon the magnesian salts in sea-water were :—



Magnesia chloride + calcic hydrate = magnesic hydrate + calcic chloride.

Magnesic sulphate + calcic hydrate = calcic sulphate + magnesic hydrate, the sulphate of lime crystallising with water as :— Calcic sulphate + water = hydrated calcic sulphate, a substance of great bulk compared with the lime base.

The lime of the cement took up the free carbonic acid from the sea-water, forming carbonate of lime ; the sulphate, carbonate and hydrate of magnesia in the sea-water were filtered out and united with the lime, forming a deposit of magnesia and hydrated sulphate of lime, which, being bulkier than the lime base, caused swelling and disintegration of the concrete, while the magnesia destroyed the adhesive power of the cement. The author proceeded to point out, from experimental tests carefully made, that the presence of magnesia in the cement, before mixing with water and setting, was not the cause of subsequent disintegration, and that even 5 per cent. of magnesia in the cement only diminished its tensile strength 20 per cent., causing no tendency to disintegration. Sulphate of lime and carbonate of lime might similarly be present in the unslaked cement without much harm or any tendency to subsequent disintegration of the concrete. The disintegration was clearly due alone to the chemical reaction between the sea-water and the lime of the cement. All the lime (about 60 per cent.) of the cement was, so far as affected by this action, quite free, there being no stable chemical combination of the lime, alumina, &c., in cement. A series of experiments on the filtra-

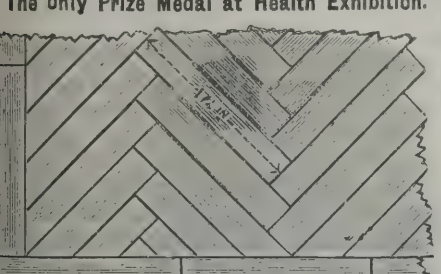
tion of sea-water from a height of 24 feet through porous blocks of concrete was given in a tabular form in an appendix, showing, by the gradual decrease of the quantity of water passing through, the closing up of the pores of the concrete by the accumulation of the chemical by-products in the material. The paper concluded with a description of the effect of the compression of air by the inflow of sea-water to cavities in the breakwater in bursting out the concrete blocks forming the sides of the cavities. The conclusions arrived at were—that the chief causes of the destruction of concrete sea-works were the chemical action of sea-water and the sudden compression of air within the structure by waves, and that the same remedy applied to both evils, namely, the formation of an impermeable homogeneous structure.



REFUSE-DESTRUCTOR, ASTON.

THE foundation-stone of a refuse-destructor which the Aston Local Board purpose erecting at their sanitary depôt, Chester Street, at a cost of 6,138*l.*, has been laid. The work will be carried out by Messrs. Manlove, Alliott & Co., of Nottingham, the engineer being Mr. W. A. Davies, surveyor to the Local Board. The refuse is put into the destructor, and from it there are sufficient ashes and combustible material found to keep the furnaces going when once lighted, no other fuel being necessary. The temperature of the furnaces ranges from 400 to 1,000 deg. Fahrenheit, according to the firing, and considerably less heat than the lower is sufficient to effectually destroy any germs of disease, and to consume the injurious products of combustion before being passed into the open air. Patent fume-cremators are also provided, through which all gases from the furnaces pass, and over a fire the temperature of which sometimes reaches 1,500 deg. Fahrenheit, from thence conducted into a chimney-shaft 160 feet in height. The intense heat, which it is estimated will be sufficient to develop 45 horse-power, will be utilised for driving machinery and generating electricity, and in dealing with the clinker or residuum which will be left after the burning. This residuum can be ground up for concrete, mortar, or made into paving-blocks, or used in the construction of streets, and a suitable boiler is provided in the main flue of the destructor. The amount of house refuse and street sweepings, &c., to be disposed of is 30,000 loads per annum. Part of this can be carted to tip, and about 10,000 loads can be sold to farmers for the land. Each of the eight cells of the refuse-destructor, it is estimated, will burn from eight to nine tons per day of twenty-four hours, and the eight cells should burn, if properly stoked and attended to, about 22,000 tons per annum. The works consist of an eight-cell destructor, roofed over, and in connection with the same is Jones's patent fume-cremator. A chimney-shaft, 160 feet in height, and an inclined approach for the carts to be drawn up to discharge the refuse on the top of the furnaces, which are 14 feet above ground level and fed from above, will also be provided.

THE METROPOLITAN WATER SUPPLY.

NOTIFICATION is given of an intended application to Parliament next Session by the Corporation of the City of London and the London County Council for an Act to authorise and provide for the appointment of a Water Committee, to consist of members chosen by the Corporation and the Council. The Act will contain clauses for conferring on the Council power to promote Bills in Parliament to acquire, construct and maintain waterworks, &c., and to do "any necessary acts in connection therewith to afford a new or supplemental water supply;" to acquire or lease any existing or future waterworks; to provide for the dissolution and winding up of any water company whose undertaking shall be acquired by the Council; to sell, lease or dispose of any such undertaking, or portion thereof, at any time vested in the London County Council; and to make provision for raising the money which might be required for carrying the intended Act into effect, or any Act promoted or obtained by the Council in pursuance of the intended Act. By other clauses power will be asked for "to supply the inhabitants, or any county, or local authority, or corporation within such area, and on such terms as Parliament shall from time to time authorise or direct, with water by meter or otherwise, for all public and private purposes;" and "to carry on, consolidate, enlarge and improve such undertakings as the Council may, by authority of Parliament, acquire or construct, or to regulate and control the water companies and their undertakings." The Bill will contain clauses for conferring on the Water Committee powers to make and enforce regulations for prescribing the strength, character, &c., of fittings and appliances for preventing the waste and undue consumption of water; to make any public or private inquiry into the existing supply within the metropolitan

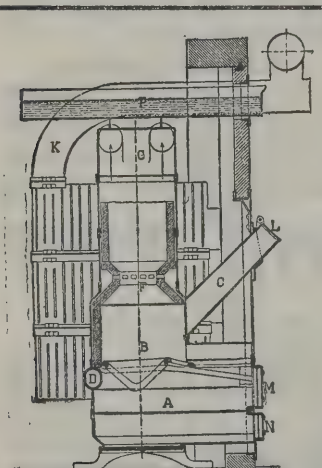
water area, and the charges made for the same, and into the possible future sources of supply; to enter into negotiations with any public authority, &c., for acquiring or leasing any of their powers or undertakings, and to empower the London County Council to delegate to the Water Committee "certain administrative powers for carrying on the supply of water which may be conferred on the Council by the intended Act." The Bill will also seek to confer on the London County Council and the proposed committee "powers as to the entry upon lands and works of any water company, and the inspection of the same, and the plant therein, and to require the production of books, documents and accounts by any water company;" and, further, to provide for the payment of costs, &c., out of the county rate.

A BUILDING DISPUTE.

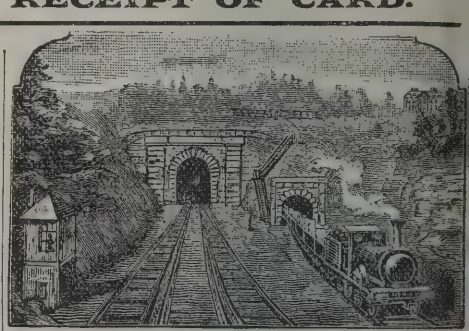
AT the Tavistock County Court, the claim of Mr. Isaac Roskilly, builder, Calstock, against Mr. Joseph Bowhay, farmer, Calstock, for 42*l.* 3*s.* 7*d.*, for work and materials, again came before his honour Judge Edge. This case was before the court on September 19 last, and on the suggestion of the judge was referred to Mr. Snell, of Plymouth, for arbitration, but as he was unable to act at the time, by the consent of both solicitors the matter was referred to Mr. T. Lang, of Liskeard. He had made his award in favour of the plaintiff for the full amount claimed, with an additional charge of 17*l.* 16*s.* 8*d.* against the defendant as personal costs in connection with the making of the award. It was explained that Mr. Lang was engaged four whole days going into details, measuring quantities and testing the value of the work. Mr. Lang had also to engage a carriage and pair to take him to and from Calstock each day. His honour confirmed the arbitrator's award, and judgment was entered accordingly.

SANITARY ENGINEERING.



MR. JAMES THOMSON, C.E., gave a lecture on "Sanitary Engineering: its Present and Future Position in Relation to the Architect's Work," at Edinburgh, at a meeting held under the presidency of Mr. J. H. Anderson, C.E., vice-president of the East of Scotland Engineering Association. The lecturer considered the drainage arrangements of the better class of houses in Edinburgh were models worthy of imitation. On the subject of water waste he suggested that, instead of the costly and irritating inspection of water fittings in houses for this purpose, the Water Trust should carry out experiments on a large scale for the purpose of thoroughly testing the different systems of hot-water supply piping, with a view to lessening the enormous waste which goes on in connection with this class of piping. The recent movement for the registration of plumbers was considered to be already showing its beneficial effects in the trade. A discussion followed, and at the close the lecturer was cordially thanked for his interesting paper.

LONDON BOARD SCHOOLS.



THE action taken by the School Board of London against Mr. Johnson, contractor, has ended in judgment for the defendant. The case, it will be remembered, came before Mr. Justice Denman lately, who postponed judgment, which has been given as follows:—

The plaintiffs in this action sought to recover very large sums of money, amounting, on the whole, to 4,000*l.* odd, against the defendant in respect of work done or omitted to be done by him some years before action brought on three Board schools which defendant undertook to erect for the plaintiffs under three contracts which, for all practical purposes, were identical in their provisions. The defendant had been paid soon after the completion of the several schools upon certificates of the architects, but it was contended that the Board was entitled to claim damages notwithstanding the lapse of time since the receipt of the sums paid, and notwithstanding the architects' certificates, by reason of the special provisions of the contracts between them and the defendant, and on the ground that the payments made to him had been obtained by fraud. The provisions of the contracts bearing upon the disputes between the parties were contained in the contracts themselves and in the specifications and conditions annexed thereto. The prices were respectively 11,600*l.*, 12,200*l.* and 12,900*l.*; total, 36,700*l.* The main provisions constituting the relation between the parties were contained in the following conditions: Nos. 3, 4, 5, 9, 11, 16, 19, 20 and 22. The plaintiffs on March 24, 1890, brought their action for alleged breaches of the three above-mentioned contracts, and it is important to observe the exact nature of these complaints as set out in their statement of claim. The defendant in his defence denied that he had been guilty of any fraud, default, or wilful deviation, and in

paragraph 4 set out the 20th condition of the contracts, which provided that a certificate of the architect showing the final balance due to him was to be conclusive evidence of the completion of the works, and that the balance was payable. The defendant alleged that he had received such certificates, and that the time provided by condition 16 (*i.e.* four months) had long since elapsed. The plaintiffs delivered particulars at various times of defects which they alleged to have been discovered and to be due to fraud, default, or wilful deviation. I do not think it necessary to call attention to the mere question of the dates of the discovery of the several alleged defaults, for reasons which will be obvious presently.

The case came on to be heard before me and a special jury on May 5 last, when counsel for plaintiffs proceeded to open the case. It very soon became apparent that the case was one wholly unfitted for investigation by a jury, as it consisted of three claims for sums respectively of 2,130*l.*, 1,000*l.* and 880*l.* made up of numerous kinds of alleged deficiencies in multitudinous matters, said to have been improperly dealt with by the defendant, and requiring a protracted examination of plans and documents by a person having such knowledge as only architects and surveyors possess. The parties having desired my opinion as to the construction to be put upon clause 22 of the conditions, I intimated that I thought that the plaintiffs, in order to recover, would have to make out something in the nature of what is popularly known as "scamping the work" in order to entitle them to go behind the certificates given three or four years before action, and after some discussion the counsel agreed that it should be referred for inquiry and report to an architect to be chosen by me who should investigate and report to me on the claims in the action, and that upon his report I should direct judgment from which there should be no appeal, and deal with all costs; and an order was drawn up by consent to that effect. I appointed Mr. Henry Arthur Hunt, of 45 Parliament Street, architect and surveyor, to hear the case and report upon the questions raised by consent of the parties, which were as follows:—1. Was the defendant guilty of fraud in carrying out the contract? 2. Was the defendant guilty of scamping the work, with a view to his own interest? 3. Was the defendant guilty of wilful deviation from the contract in the sense of intentional and substantial departure from the contract, with a view to his own interest? 4. To what amount, if any, are the buildings the worse for the defects consequent on the defendant so being guilty of each of the three previously named breaches, if any, and (if not necessary to replace) what the defendant has saved by such breaches? Mr. Hunt, in pursuance of this order, held an inquiry, which lasted upwards of twenty days, and inspected the schools in question, so far as he deemed necessary, and heard counsel and witnesses for both sides, and eventually, on August 10 last, reported to me as will appear presently. The case was put in the paper for judgment on the last day of the sittings before the Long Vacation, but it was then agreed by both parties that the report raised questions which would require more discussion than the parties had contemplated, and that it would be better that it should stand over for discussion until after the Long Vacation. Accordingly, on October 31 the case came before me again, and after some further discussion it was agreed that I should, after going through the shorthand notes of all the proceedings before Mr. Hunt (which I have since done), and ascertaining from him his intentions as to the ambiguous expressions in his report, give judgment without further argument, unless I saw any reason for requiring further discussion. Having now had the opportunity of seeing Mr. Hunt and obtaining his view of the case, I see no reason for abstaining from giving judgment; but before stating the result at which I have arrived it will be right that I should state seriatim the result of the inquiries I addressed to Mr. Hunt as to the exact intentions of his mind in all cases in which the language of his report is at all ambiguous; and I may add that, having carefully gone through the shorthand notes of all the proceedings before him, I can see no reason to doubt that the conclusions he has arrived at, as now more fully reported to me, are the correct conclusions to be drawn from the evidence upon a correct view of the questions upon which the case turns.

The first finding is as follows:—"The defendant was not personally guilty of fraud, but to a small extent a plumber was guilty in laying light lead in the gutters to the amount of 7 cwt., of the value of 5*l.* 5*s.*" Mr. Hunt informs me that he was clearly of opinion, and indeed the learned counsel who conducted the case before him was obliged to admit that in no single case was there any reason to suppose that the defendant had any fraudulent intent. The finding with regard to the plumber's conduct was inserted by him in consequence of an argument that nevertheless the defendant might be responsible because the plumber who laid light lead to the extent of 5*l.* 5*s.* in the gutters was an agent for the defendant, and so the defendant was responsible for his fraud. He informs me, however, that this act of the plumber was known to no one else. I am not of opinion that it was the intention of clause 22 of the

conditions that in such a case as this the Board should be entitled to go behind the architect's certificate at any time within the four years as contended for the plaintiffs. I do not think that the cases relating to liability for fraud of an agent apply to such a case, or that defendant, in the absence of personal fraud, can be rendered responsible, however fraudulent the conduct of the plumber may have been.

The second finding was as follows :—"I say that generally the work has been well done, notably the leadwork, the joiner-work, the plasterwork, the brick and stonework, and that although there are serious failures in the drainagework of at least one school, I do not consider that, as a whole, the work has been 'scamped.'" It is obvious that this finding is open to the objection that it does not answer the question put, but, after reading the shorthand notes and making full inquiry of the referee, he informs me that he considers the fair result of his minute inquiry to be this :—(1) That, looking at the work done under the three contracts as a whole, he is of opinion that it was well and conscientiously done ; (2) that as regards the drainage there were serious defects ; but (3) that these defects were not due to any desire on the part of the defendant to obtain any advantage for himself, nor on the part of any foreman employed upon the works to make the contract a more advantageous one for the defendant, but that such defects were due to the slovenly work of the persons actually engaged upon the work, which ought to have been objected to at the time by the plaintiffs' clerks of the works, who were not called as witnesses, and who seemed to him to have done their part in the most perfunctory manner. I may say that upon this part of the case there was a serious conflict of evidence between a witness named Keech and a foreman of defendant's named Spicer, as to which the referee felt himself unable to accept the version given by Keech, who was the plaintiffs' witness, as against that of Spicer, who was called by the defendant. But even assuming that there was some blame to be attached to the defendant's foreman in respect of the work done and the deviations from the contract, so far as the drains were concerned, I think the referee is right in the view he takes of the case, viz. that the defects in the drains cannot be ascribed to any desire on the part of the defendant, or anyone responsible to him, to put money into his pocket, but rather to a loose surveillance on the part of the plaintiffs' clerks of the works and to an erroneous notion thereby entertained by the defendant's workmen that what was being done was being done in exact accordance with the contract, or at most to a still more erroneous notion that it would be pleasing to the defendant if they did the work at less expense to him than if it were done in strict accordance with the contract.

As to the third question, I have had considerable difficulty in appreciating any distinction between its meaning and that of the second question ; but it is not necessary to discuss this question in the view I take of the findings, which were as follows :—"I say there have been substantial departures from the contract—(1) with the full cognizance of or to comply with the wishes or orders of the clerks of the works, which have doubtless put money in defendant's pocket, but should have been adjusted by the measuring surveyors in the usual way ; (2) there has been a departure in the width of the wall-gutters. Although it is difficult to ascertain from the drawings what the width should be, and the specification does not explicitly state the minimum width of a wall-gutter, still I am of opinion that about 20 cwt. of lead has been saved in two of the schools and 3 cwt. additional put into the third." Here, again, it was necessary that I should ascertain from the referee the full meaning of his findings, and upon inquiry as to these I find that what he intends to report, and I can see no reason for dissenting from his conclusions, is as follows :—1. That there are several cases in which work has been done in a way substantially different from that provided for in the contract and specification, and that in some of such cases the effect has been to put money into the pocket of the defendant, but that the work as actually done was either expressly sanctioned by the clerks of the works of the plaintiffs or done with their full cognizance, and that in other cases of such departure the defendant might have claimed an addition to the contract price which on adjustment after measuring the work might have been set off against the cases in which defendant had been the gainer by other departures, and that no such adjustment had taken place. 2. That in the case of the wall-gutters the contract had been departed from, but that, owing to the ambiguity of the specification and drawings applicable to each work, there was no reason to impute any unfair intention either to defendant or his foremen in consequence of such departure. The referee on inquiry reports to me that he did not intend to report that in either of the above cases there was, in his judgment, any intentional departure from the contract either by defendant or his men, with a view to either his or their own interests.

The answer to the fourth question put to the referee was as follows :—"I beg to state that with the exception of the drainage I do not consider that it is necessary to replace or take up and

restore any of the work, but I am of opinion that the defendant has saved by the abovenamed breaches the sum of 240*l.*, and to make good defects which have manifested themselves the sum of 175*l.* should be allowed." The answer of the referee to this question at first sight seems inconsistent with the last statement in relation to the answer to question (3), because it seems to be an answer which assumes a liability under one or other of the former answers; but he informs me that he did not intend by the use of the words "by the above-mentioned breaches" to adopt the words of the question "so being guilty of the three previously-named breaches" so as to find that there had been any breaches amounting to fraud, or scamping, or wilful deviation with a view to defendant's own interest, but only to assess the damages for deviation and defects in case the defendant should be held liable in spite of the admission that he was not guilty of any personal misconduct, of himself or by others for whom he was responsible, on the ground of such deviations having been established.

The last finding of the referee as to the time of discovery of defects becomes immaterial in the view I take of the whole case, but he has added two paragraphs to his report which are not in answer to any specific question. They are as follows:—"I have not especially reported on many of the claims in the particulars which I have not considered proved, neither do I mention the amount of work which the defendant did over and above the contract and for which he has not been paid, as I am of opinion that, as the defendant has not made any counterclaim he is not entitled to any set-off. In conclusion, I would beg leave to remark that the defects that have manifested themselves in the buildings could not have existed without the contributory negligence of the School Board and its agents."

In order to avoid misunderstanding I may as well state that I think he was fully entitled to take into consideration, when deciding such questions as the first three submitted to him, the fact that there were cases in which the defendant had done work beyond the requirements of the contract and made no claim for it, only as bearing upon the question whether he was actuated by a desire to put money into his pocket beyond what he was fairly entitled to, though he was right in not considering the liability of the defendant (if he was liable at all) as being entitled to be diminished by the amount of extra expense incurred by him in respect of such work beyond the requirements of the contract, no counterclaim having been pleaded. The last paragraph of the report might have been omitted, but it was inserted in consequence of the importance naturally attributed to a fact which is amply proved by the evidence which I have read through, viz. that throughout the work there was so much laxity in the attendance and surveillance of the work by the Board's clerks of the works that the workmen of the defendant were not controlled from committing errors, the very object of appointing clerks of the works being to prevent errors and rectify them during the progress of the works. On the whole I have no hesitation in giving judgment for the defendant with costs.

PATENTS.

A Business Supplement

The Contract Reporter.

to The Architect.

LONDON, DECEMBER 4, 1891.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the office, 175 Strand, London, W.C., not later than 5 P.M. on Thursdays.*

Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—"Contract Reporter to THE ARCHITECT."

IMPROVED
FLAT BRICK FIRE-PROOF FLOORS.

Transverse Section.

Longitudinal Section.

NO THRUST ON WALLS.

The BEST as well as the CHEAPEST Fire-proof Floors yet introduced.

THEY are constructed with purpose-made hard-burnt bricks, with moulded projections protecting the iron, and provided with wedge joints throughout, forming the most compact and solid floor known

The soffits of the bricks are specially prepared to key up the ceiling plaster. No laths or counter ceiling are necessary. They are not affected by water, acids, or alkalies, and they may be fixed during the progress of building, thus dispensing with the use of internal scaffolding.

The floors are practically noiseless, the different densities of the concrete, brick and plaster, with the air space above, intercepting the sound vibrations.

The depth of the finished floor is 6 to 9 inches only, and when the saving on this head is taken into account, the cost of a building with floors of this construction does not exceed that of one with the ordinary combustible timber floors of corresponding strength.

TO ARCHITECTS AND BUILDERS.

Fountain Street, Bury, and Shiffnall Street, Bolton:
February 13, 1891.

Gentlemen,—We have pleasure in announcing that we have opened extensive Show Rooms at 117 QUEEN VICTORIA STREET, LONDON (opposite Civil Service Stores).

We have been very successful in Lighting and Ventilating Public Buildings in all parts of the Country.

We have a large stock of Sunlights, Turrets, Exhaust Roof Outlets, Tobin's Tubes, Air Grids, &c., &c., at our Show Rooms.

We feel confident that our **DESIGNS**, as well as our system of Lighting and Ventilating will commend themselves to all who are interested in having BRILLIANTLY LIGHTED and WELL-VENTILATED ROOMS.

A visit to our Show Rooms will be esteemed a favour. If inconvenient to call, send for one of our Illustrated Catalogues, inspect our Designs, and read our Testimonials.

Trusting to receive your favours, which shall have our prompt attention,

We remain, Gentlemen, yours obediently, **J. H. PICKUP & CO.**

WEST BROMWICH.

For Building Board Schools for 1,110 Children, West Bromwich. Mr. ALFRED LONG, Architect, High Street, West Bromwich. Quantities supplied.

Accepted Tender.

John Mallin, West Bromwich (including best facings) £8,987 3 0

TRADE NOTES.

Mr. JOHN GRUNDY, of Duncan Terrace, London, and Tyldesley, near Manchester, is supplying his patent warm-air ventilating grates to Wilbury, Salisbury, the seat of Sir Henry Malet, Bart.

THE new mission-room, Longport, near Burslem, is being warmed and ventilated throughout by means of Shorland's patent Manchester stoves, the same being supplied by Mr. E. H. Shorland, of Manchester.

THE ventilation of Chadwell St. Mary's Board Schools, Tilbury, has been entrusted to Messrs. Baird, Thompson & Co., ventilating engineers, London and Glasgow, who are introducing their latest improved patent exhaust roof ventilators for the extraction of the vitiated air.

THE Glasgow Town Council Electric Lighting Committee have made arrangements for the purchase of a site for the erection of buildings in which to place the electric plant for lighting the central area of Glasgow. The ground is situated in Bishop Street, Andorston, and the price to be paid is 8,000*l.*

WORKS of improvement have been carried out at the premises of Mr. Newman, wine merchant, Shrewsbury. In place of the narrow and inconvenient old smoke-room, a spacious and lofty room has been provided. The ventilation of this room is perfect, and it is lighted by a handsome Wenham gas pendant. The room is newly-fitted up. The floor of the public bar has also been lowered to the street level and the premises generally made convenient for the large and increasing business. The work has been carried out by Mr. Henry Price, builder, Shrewsbury.

AT a special meeting of the St. Helens Water Committee, the tender of Messrs. Oakes & Co., of Alfreton, Derbyshire, was accepted for the supply of 5,400 yards of 6-inch pipes for a new water main between Sutton and Brown Edge. The question of the acceptance of tenders for the plant for the purifying process was not settled.

A COMPANY is being formed for the purpose of constructing a pier at Rhos Fynach, near Colwyn Bay. Powers are asked in the draft provisional order to construct on the pier pavilions, aquaria shops, reading and refreshment-rooms, swimming-baths, &c. The pier will be about 500 yards in length, and will be suitable for the landing of passengers and goods from steamboats, &c.

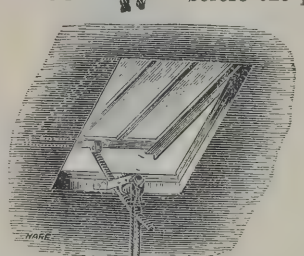
THE London County Council have approved of the following recommendations:—That the sanction of the Council be given under seal to the borrowing by the vestry of St. Pancras of the sum of 60,000*l.* towards defraying the cost of certain electric lighting works, at a rate of interest not exceeding 4*l.* per cent. per annum, and the principal being repaid by equal annual instalments within a period of forty-two years from the date of the loan. That the Council apply to Parliament for power to make advances for electric lighting purposes to vestries and other rating authorities within the county of London, for periods not exceeding 60 years, and that it be referred to the Parliamentary Committee to take steps to obtain the necessary statutory authority for that purpose.

VARIETIES.

AT the meeting of the Salford Town Council Mr. Alderman Mottram inquired whether the Mayor would call an early meeting of the General Purposes Committee to consider the desirability of erecting a new Town Hall upon the present or some other approved site, more suitable to the requirements of the borough, as the present building was not sufficiently commodious for the efficient carrying on of the municipal business. The Mayor said he intended to bring that matter forward early in the new year.

THE building of hotels at Monte Carlo has been carried to such an extent during the past few years that the Prince of Monaco has now put his foot down, and issued an irrevocable edict that no more are to be erected for some time to come.

A PORTION of the clerestory of the beautiful old church of All Saints, Barrington, Cambridgeshire, has just fallen with a crash on to the roof of the south-east aisle. The edifice is in many parts in a dilapidated condition and requires restoration.



PLANS have been prepared for the construction of a new railway bridge across the Thames at Bourne End, Marlow, in

place of the present unsightly structure. If approved, the work will be commenced about next Easter. The proposed bridge will be built on brick piers, and will be wide enough to accommodate a double line of rails. The estimated cost is 6,000*l.*

THE Newbury Town Council have received from Mr. Baldwin Latham his report in reference to the proposals for the sewerage of the borough, concerning which he was recently engaged to advise.

THE threatened water famine in New York has become very serious. The water in the reservoirs is very low, and little is coming into them. The daily consumption has been cut down from 165 million gallons to 100 millions. It is feared that the water in the Central Park reservoir, kept to fall back upon in case of fire, will have to be drawn upon if rain does not quickly fall. The police have difficulty in preventing the inhabitants from using the water wastefully, and washing of side-walks and windows with hose is forbidden. All public drinking-fountains and troughs have been closed. The engineers of the water-works are very anxious.

THE Royal Commission on the Chicago Exhibition are informed that the contract labour laws of the United States will not prevent exhibitors from importing foreign labour, or from entering into binding contracts with their employés.

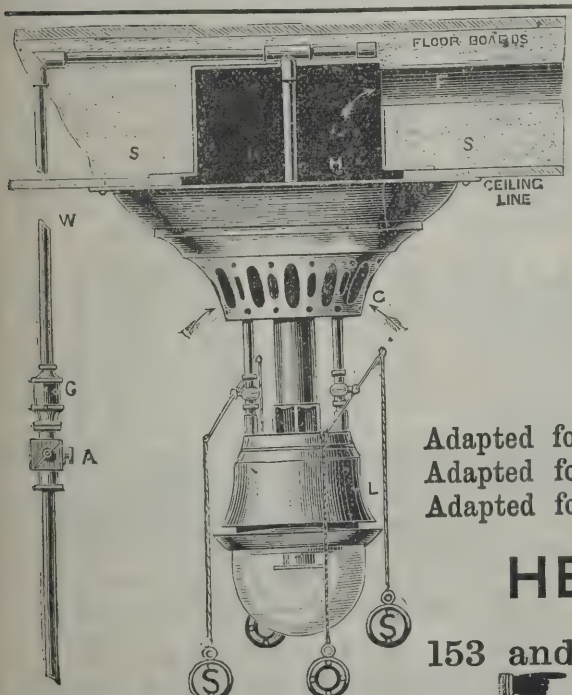
AT the meeting of the Glasgow Dean of Guild Court the petition of Messrs. Stewart & McDonald for sanction to erect a gangway across Mitchell Street, connecting the two portions of their warehouses was refused, and the petitioners found liable in expenses.

MRS. J. T. HIBBERT has intimated her intention of building a new church at Field Broughton, Grange-over-Sands, at a cost of 3,000*l.* She will also give the site.

THE destruction of the old Elizabethan mansion at Bourn, Lincolnshire, in which, tradition says, the Guy Fawkes conspiracy was hatched, has been decided upon. The old Red Hall, as it is called, was for a century or so the home of the Digby family. A new railway is being made by the Great Northern Railway Company from Bourn to Saxby, and the mansion stands in the way. A large number of influential residents in Lincolnshire have united with the Society for the Protection of Ancient Buildings in petitioning the company to divert their line and spare the building.

THE great importance of sanitation with regard to building-construction has induced the Worshipful Company of Carpenters, in conjunction with the Sanitary Institute, to establish examinations in sanitary subjects. These examinations are intended to be suitable for clerks of works, builder's foremen, and others who have to deal with the construction of buildings. For the benefit of candidates who propose to attend the examinations, a course of nine lectures has been arranged, and will be given at the Carpenters' Hall during the months preceding the examinations. The Carpenters' Company have for some years past carried on examinations in carpentry, and the Sanitary Institute's examinations for inspectors of nuisances are also very well known. There is no doubt therefore that these joint examinations, dealing with the practical and sanitary requirements in connection with the building trade, will become very popular.

THE *Staffordshire Advertiser* says:—Considerable difficulty was experienced in discovering the exact situation of the old town well, Brewood, which it was necessary to find in order to commence preparations for the erection of the memorial to the late Major John E. Monckton. The well has been closed over half a century, and, although some of the oldest inhabitants were consulted, no one could tell exactly where it was situated. Many of the inhabitants took a great interest in the matter. It was discovered nearly in the centre of the Market Place, and when opened was found to be in a good state of preservation. It was about 54 feet deep, and contained about 14 feet of water. It may interest Brewood readers to know that about eighty years ago an old market cross stood near this well. On the coming of age of Mr. Thomas William Giffard, "the twentieth lord of Chillington," in 1810, some men were bringing a waggon of coal into the market-place to roast an ox in commemoration of the event. The waggon either shook down or knocked down the old cross, and it was never restored.



AT a meeting of the Llangefni Local Board, held on Friday, November 27, it was resolved to instruct Mr. Charles H. Beloe, M.Inst.C.E., of Liverpool and Westminster, to proceed with the details of the plans necessary for the sewerage and water-supply of this place, and to open negotiations with the landowners for the purchase of the lands required, forthwith. Mr. Beloe's designs were selected by the Local Board out of the six sets of plans submitted to them by engineers in various parts of the kingdom. The town of Llangefni is rapidly increasing in importance, and new offices are about to be erected there for the County Council, together with other public buildings, and it soon will be in fact, if not in title, the capital of Anglesey. It was therefore quite time that an efficient scheme of sewerage and water-supply should be provided for the town.

Reading Cases for the Architect.—Price Two Shillings. Office: 175 Strand, London, W.C.

IN a private Bill promoted by the London County Council it is proposed either to purchase Lincoln's Inn Fields Gardens for public recreation compulsorily, or to transfer the rights of the existing trustees to the London County Council. These trustees were originally appointed in the reign of George II., when an Act was obtained to enclose these gardens, which comprise seven acres, and to vest them in twenty-one trustees, who were empowered to levy a rate for their maintenance upon the proprietors and inhabitants of the surrounding houses. The vacancies in the Board of Trustees are still filled from among those upon whom the rate is leviable.

"A ROYAL DIVORCE," Mr. W. G. Wills's historical drama, is still one of the biggest successes in London, the New Olympic Theatre being nightly filled to its utmost extent. So popular has this play become that in order to meet the growing demand for seats an extra *matinée* is now being given on Saturday in addition to those on Monday and Wednesday.

CHICAGO EXHIBITION NOTES.

THE Council of the American Society of Mechanical Engineers has appointed a committee to devise and recommend a series of efficiency tests of engineering appliances. On this committee are Chas. E. Emery, who was in charge of the steam boiler tests at the Centennial Exposition, and Professor R. H. Thurston, of Cornell University, who was a commissioner to the Vienna Exposition of 1873, and a member of the jury of the Paris Exposition of 1889.

W. A. ALEXANDER & LOUIS GELDER, representing the insurance associations of Chicago, have asked for space, 50 by 100 feet, to construct a building at the Fair to constitute an exhibit of the most improved methods of fireproof construction and the appliances used in saving goods from burning buildings. The building, it is urged, can be occupied by a salvage corps during the Fair.

THE Illinois Board of World's Fair Commissioners has ordered specifications for the architectural reproduction in drawings of all the Illinois State institutions and public buildings, sixteen in number.

WILLIAM ORDWAY PATRIDGE, the great sculptor, has asked for space in the Art Palace for his statue of Shakespeare, which he is now making for Lincoln Park. His statue of Alexander Hamilton, which he is making for the city of Boston, will also be shown. Mr. Patridge is vice-president of the American Artists' Association in Paris.

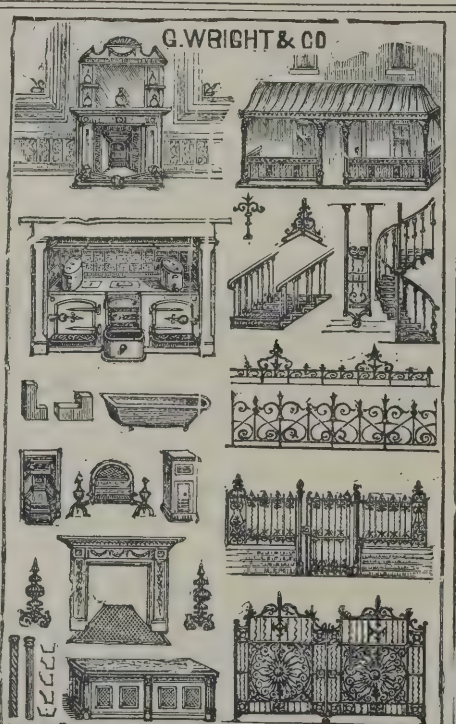
MR. SELL, the London advertising agent, has applied for space to exhibit specimens of all the leading newspapers of the world which have been printed during the last two centuries.

THERE will be a model hospital in the Women's Building separate and distinct from the official hospital of the Exposition, of which Dr. Owen is director, being rather in the nature of an exhibit. It will, however, be fully equipped with physicians and trained nurses, a veritable model hospital, prepared to handle the gravest cases of accident or illness.

MR. TAKAHIRA, Japanese Consul-General in New York, who was specially commissioned by the Mikado to look into Exposition matters, has made a formal application to Director-General Davis for 124,100 square feet in the several buildings and on the Midway Plaisance as follows:—For an official Japanese building, 40,000 square feet; in the Manufacturers' Building, 35,000; Agricultural Building, 4,000; Fine Arts, 2,000; Mines and Mining, 750; Forestry, 350; Bazaars, 42,000.

THE Exposition attractions in the vicinity of the main lagoon entrance, just south of the great Manufactures Building, are to be quite different from those originally planned. No Casino will stand at the end of the pier 1,000 feet from shore, and there will not be a curved mole bearing columns emblematical of the thirteen States. In place of the latter there will be a peristyle, 60 feet wide and 500 feet long, extending north and south and spanning the lagoon entrance by a grand arch. Ranged along this peristyle will be emblematic columns representing all of the states and territories. At the north end of the peristyle will be placed the Music Hall, which for a time it was thought would have to be put on the wooded island. It will measure 140 by 200 feet, and will have an auditorium large enough to seat 2,000 people with an orchestra of 75 pieces and a chorus of 300 persons. It will also have a rehearsal hall 50 by 80 feet, capable of seating 600 people.

THE grand choruses and band concerts—the popular musical entertainments—will be held in an amphitheatre accommodating 15,000 people or more. This will be in the extreme southern part of the park, and after the close of the projected musical programme will be transformed into a live-stock show-ring.



AT the south end of the peristyle there will be a restaurant and café, of the same size and style as Music Hall. This will be constructed to supply the main features of the abandoned

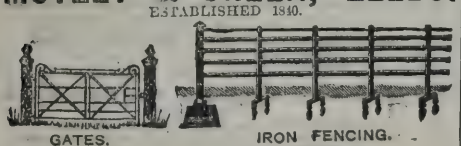
Casino. The plans for these changes, which have been adopted by the ground and buildings committee, were made by Designer-in-chief Atwood, of the Construction Bureau. The estimated cost is 206,000 dols., or 1,000 dols. less than would be necessary to carry out the plans which were abandoned.

THE pier, extending 1,000 feet into the lake, is already completed. At its extremity, in place of the Casino, will be erected a tower 250 feet high. This will be of iron, covered with staff, and will resemble a lighthouse in appearance. From its summit electrical displays of exceeding brilliancy will be made, and by means of electric "search-lights" the grounds, or any particular portion of them, can be flooded with light on fête nights.

THE TIMBER TRADE OF HONDURAS.

THE Bureau of American Republics in Washington has received information in regard to the timber industry of Honduras. The first wood-cutters in the territory went to Belize 150 years ago, taking with them their slaves and their cattle, and since that time Belize has been principally occupied with the various camps or mahogany works, which extend between the rivers Ulua, Chameleon, Patteck and Wanks, on the Atlantic coast. The timbers at present most sought after for shipment are mahogany, cedar, rosewood, zebra and fustic. Mahogany and cedar are the trading exports, and are shipped mainly to England, although some contracts have recently been taken in the United States. The price of mahogany in London ranges from 110 dols. to 175 dols. per 1,000 superficial feet, and cedar from 90 dols. to 180 dols. Rosewood, zebra and fustic are cut into short lengths and shipped as ballast. Rosewood brings from 25 dols. to 40 dols. and fustic 30 dols. to 40 dols. The logs are squared before shipment. The timber on Government land is free to anyone who proves to the Administrator of Customs that he has ample means to transport it to market, a great deal having been lost before the adoption of this rule through the timber being left to decay after being felled. It can be cut at any time of the year, but the best season is during the rainy months, so that the logs may be ready by the beginning of the dry season, on March 1. The camp is generally composed of from twenty to fifty men, who are divided into companies, each having a captain. A foreman, in charge of the whole camp, keeps account of logs cut and other details. One man, called the hunter, looks up the trees fit to be cut and reports to the foreman, who examines each one. Care is taken not to fell any trees less than 8 feet in circumference. The cutting is done by piecework, two trees from 8 feet to 12 feet being a day's work for one man, and a tree 25 feet in circumference being regarded as a day's work for four men. Over 300 trees are sometimes felled in a camp in a single season. The carriage of lengths to the river banks is done principally at night. A foreman's wages will vary from 60 dols. to 100 a month, with occasional allowance of an extra servant; first captain 18 dols. to 20 dols. a month, with rations, and choppers 10 dols. to 14 dols. a month, with rations. The export duties on mahogany and cedar are 8 dols. per 1,000 superficial feet.



THE KRASNAPOLSKY RESTAURANT AND WINTER GARDEN.

A WONDERFUL transformation has lately been effected in connection with the premises of the above institution, situated in Oxford Street, which will be reopened to the public on Monday next, and one that is calculated to cause considerable interest, not only among the *jeunesse dorée*, but also the more staid portion of the community, inasmuch as no expense has evidently been spared, conducive to elegance and luxuriousness, and if, as has been insinuated, we English continue to take our pleasures sadly, no fault can attach to the promoters of this particular festive resort, the title of which is derived from its managing director, Mynheer Krasnapolsky, who has gained a wide reputation at Amsterdam and other Continental towns as a successful *restaurateur*, while the other directors include Mynheer Maas, the Netherlands consul, and Mr. Cecil Gladstone. The secretary is Mr. J. Davis, through the courtesy of whom we were privileged to make a private tour of inspection some days ago.

In regard to the external portion of the building facing Oxford Street there is little to be said beyond what may be fairly commendatory, although an important improvement is to be effected as soon as the permission of the authorities has been obtained in regard to the construction of a covered way right up to the curb-stone. After entering the portal, where some artistic oak woodwork meets the eye, we enter the capacious and lofty Winter Garden, abounding with palms and various other plants, and our attention is drawn to the elegantly-designed mosaic which has been executed by Messrs. Diespecker, of Holborn. There is also a fountain here and other adornments. In the gallery above,

WOOD PAVING AND STEAM JOINERY WORKS
Clapham Junction, S.W.

access to which is gained by means of two staircases, is a handsomely-fitted-up restaurant, while the abundance of surrounding mirrors will doubtless serve to reflect many a gay and festive scene. A beautifully-executed white marble fountain will be observed in the gallery, where there is also a buffet and a recess, which latter may serve for a reading-room or other purpose. The large central dome above is fitted with a sliding roof, and all the ironwork in connection therewith has been executed by the St. Pancras Ironworks Company, and incidentally it may be mentioned that the decorative ironwork throughout the building has been executed by Mr. P. Schryvers, of Brussels. Adjoining the before-mentioned restaurant are the capacious kitchens, to which new lifts have been affixed by Messrs. Smith & Stevens.

Proceeding to the second floor, we enter the magnificent banquet-room, which has been superbly decorated, and abounds with fine oak carving. Adjoining thereto are two other dining-rooms of less dimensions, which have a comfortable and cozy appearance. These rooms are eminently adapted for the entertainment of Masonic lodges as well as private parties.

Descending to the basement, a very fine and luxurious billiard-room is discovered, in which six tables by Burroughs & Watts will be placed, so that the votaries of the game, whose name is legion, can indulge therein to their hearts' content. The dado work here has been executed by Messrs. J. Aird & Sons, who take credit also for the marble steps leading to the billiard-room, while the painting was done by Michael Hendricks, of Amsterdam. Adjoining is a large vacant space right under the winter garden, which can be utilised at any future time for such purposes as may be desired. The wine cellars, whose capacity as may be well imagined is enormous, will be found in close proximity. But we hasten to enter the boiler and engine-rooms, which are also of course in the basement, and which are fitted in a manner that cannot fail to awaken admiration. For here will be found two 30 horse-power boilers by Robey & Son, and two 20 horse-power by Ruston, Proctor & Co., together with three engines of 30 horse-power each, also by Ruston, Proctor & Co., and all, as may be supposed, of first-class quality. In close proximity are three dynamos and switch-boards, which have been supplied by Messrs. Crompton. It may be added that no vibration is experienced there, thanks to the lead and cocoanut matting which have been laid down. The work in this department has been ably carried out under the superintendence of Mr. Hartmann, the consulting engineer.

Abundant and well-fitted lavatories exist in the building, and there is a lift from the ground floor to the top that will admirably serve the intended purpose.

It only remains to add that the capacious building is fitted throughout internally and externally in the best possible style, and to Messrs. Wenham & Waters' credit is due not only for the electric wiring and fittings, but also for the heating and plumbing which has been done by them right throughout. The builders, it may be mentioned, are Messrs. Higgs & Hill, who have done all the rough construction and woodwork. The elegant decoration and the plasterwork in connection with the banqueting and adjoining dining-rooms have been executed by Mr. Allan Chambon, of Brussels. The architect over all was Mr. J. Springer, of Amsterdam, whose representative on the work was Mr. J. A. Van Voorthuysen, and they are to be complimented for the general excellence of the whole work, both in the design and internal decoration.

Brief and imperfect as is this descriptive notice, it may yet serve to give some idea of an institution which seems likely to be a centre of attraction, and to have a prosperous career before it, having regard to the elaborate manner in which the directors have gone to work, who, if they do not command success, at least thoroughly deserve it.

THE FORTH BRIDGE.

THE contractors for the Forth Bridge, Messrs. Tancred, Arrol & Co., have not done with the actions against them. Judgment has just been delivered on another taken by the Steel Company of Scotland, Limited, to recover 50,000*l.* damages for alleged breach of contract in connection with the supply of steel for the construction of the Forth Bridge. By an offer and acceptance dated February and March 1883, the company offered to supply and the contractors agreed to purchase the whole of the steel required by the defenders for the Forth Bridge, less 12,000 tons of plates. In 1887 a dispute arose as to the defenders obtaining steel beyond 12,000 tons from other sources, and an action was raised in the Court of Session to determine the question. While the question of liability was being decided the defenders admitted having purchased 5,000 tons more than they were entitled to from other sources, and decree was given against them for 14,580*l.* After considerable procedure the House of Lords found that the contractors were bound to take from the pursuers all the steel

"SPHINX" PORTLAND CEMENT

112 lbs. per bushel. Slow setting; test 1,000 lbs. to 1¼ inch; seven days. Fineness, 2,500 meshes to square inch, with less than 10 per cent. residue. Over 10,000 tons supplied to Cardiff and Hereford Water Works.

MANSFIELD STONE,

FROM THE "LINDLEY" QUARRIES

MANSFIELD

required for the superstructure of the four main spans of the bridge. The pursuers now claim 50,000*l.* in respect of other 14,000 tons of steel which they aver defenders obtained from other sources. They explain that this sum they would have made in profit in consequence of the great fall in price of steel after the contract was entered into. The defenders deny that they are due any sum in addition to the 14,580*l.* already paid.

Lord Kyllachy, in giving judgment, said he had to fix the quantity of steel on which the pursuers were entitled to have their damage calculated. He understood that that quantity being found, the parties were in a position to adjust the figures. The conclusion he had come to on the evidence was that it was impossible to fix absolutely the quantity of steel used or the waste. In the circumstances he did not think that anything else could have been expected, and the result was that to some extent he had found it necessary to deal with the matter roundly. That being so, the result was that he had found the total quantity of steel which the contractors required to order for the part of the work in question was 55,000 tons. In reaching that figure he had had to make up his mind on one or two points which might perhaps be called points of principle. First, he had found it impossible to proceed on the statement on which the pursuers' accountants had based their calculations. He thought the evidence was conclusive that that statement showed simply the quantity of steel ordered, and did not show, or profess to show, the ultimate destination of each quantity. Second, he had accordingly been obliged to have recourse to the method of computation adopted by Sir Benjamin Baker, and to find out the quantity of steel actually in the main spans or brought out in the engineers' calculations, and the quantity wasted or reduced to scrap in the course of the work. As to the first of those figures, he had, so far, not had much difficulty. He had no reason to doubt the accuracy of the measurements made from time to time by the engineers. Assuming, therefore, that the plates supplied were of the average thickness ordered, the quantity of steel in the superstructure of the main spans was, including rivets and ladders, 50,958 tons, or, excluding castings, 50,691 tons. But the questions to be considered were, first, What allowance fell to be made for waste? and second, What allowance fell to be made for what in the proof was called rolling margin—that was, a certain excess of weight beyond the weight ordered, due to the pursuers' anxiety to err within the contract margin rather by excess of thickness than by defect? Excluding rivets, &c., there appeared to have been supplied to the bridge, including steel for temporary work, in round numbers 57,000 tons. That being so, if there were only now 50,958 tons in the bridge, there must have been a waste between the main spans and the temporary work of over 7,000 tons. Making the fullest deduction for the waste applicable to the steel used in the temporary work, and not turned to account in the permanent structure, the discrepancy between the quantity supplied and the quantity found in the main spans was yet a good deal larger, as it seemed to him, than the defenders' figures allowed for. On the whole, he did not think he should do either party injustice if he added, in respect of excess of thickness of plates, and excess of waste beyond Sir Benjamin Baker's allowance, a lump allowance of 800 tons, making up the total weight to be dealt with to 55,000 tons, in place of 54,000 tons, as brought out by Sir Benjamin Baker. He had included the rivets in the above figures, because he thought the rivet steel fell within the contract. The only question remaining was whether the contract was modified to the effect of discharging the part of the defenders' obligation. On that question, if it were open, he should, he confessed, have had difficulty in deciding against the defenders. His impression was that there was in that matter a concluded verbal agreement, followed up by *rei interventus*, to the effect that the defenders might get their rivets where they pleased. But he did not think the question was open. The question was fairly raised by the conclusions of the summons in the former action. In the former action he thought it would have been competent and relevant to the defenders to plead that the rivets contract had been discharged, but no such plea was taken, and accordingly the judgment of the Court, affirmed by the House of Lords, was expressed in unqualified terms affirming that the defenders were bound over to take the whole of the steel from the pursuers. On the whole, therefore, he should find that the quantity on which damage was to be calculated was 55,000 tons, that was 43,383 tons and the 12,000 odd tons, which were supplied by the Landore Steel Company. Deducting these from the 43,383 tons, the 31,000 odd tons dealt with in the former action, there remained 11,617 tons, which was the quantity he fixed upon which damage would have to be paid. With respect to interest, he did not see any reason why it should be high, and he thought 4 per cent. would be sufficient. He supposed the parties would adjust the amount upon the quantity which he had determined and report to him the amount, for which he would give decree.

Counsel agreed to do so, and the case was adjourned for that purpose.

VOLUME XLV. OF THE ARCHITECT.
Handsomely bound in Cloth, Gilt Lettered. Price 12s. 6d.—Office: 175 Strand, London, W.C.

THE ANTECEDENTS OF GOTHIC ARCHITECTURE.*

I SUPPOSE that while we all recognise the fact that architecture is something more than constructive building, we equally maintain that it is always based upon constructive principles, and that these constructive principles are what primarily determine the respective characters of architectural styles. I conceive that in broadest classification there have existed in the world thus far but three fundamentally differentiated architectural systems—the trabeate, the inert arched and the balanced, or, to name them from their leading types, the Greek, the Roman and the Gothic. The numberless varieties of styles which have taken shape during the historic progress of the art are but so many modified forms of one or the other of these main groups.

By Gothic architecture I understand then, primarily, an architecture which is distinguished by a balanced system of construction, a system in which the side-thrusts of vaults and arches are met by well-adjusted props or braces rather than by inert masonry. And it is clear that an architecture based on such a system admits of, and logically demands, a degree of slenderness in its supporting members which would be insecure in architecture based on any other system.

It follows that among the distinguishing characteristics of Gothic construction are comparative lightness of supports and consequent large extent of openings between them. Therefore, before we can properly call a building Gothic, we must find these characteristics either developed or in process of development.

In forming the Gothic style the exigencies of the system were yet incompletely apprehended by the builders, and consequently the ultimate principles were not fully carried out. But in all transitional monuments, rightly so-called, the animating spirit of the system may be seen to be working, and tending to modify structural forms in the Gothic direction. The principal incipient forms are those of the vaulting, and it is not until these are considerably developed that the lower supports are wholly transformed and brought into agreement.

The principles which mainly governed the Gothic vault transformation are those of diminution and concentration of pressures. And it is, I think, because the exigencies of this last have not been fully recognised that so much misunderstanding of Gothic art prevailed. Our conceptions of Gothic have been so largely influenced by the belief that it is mainly characterised by the use of the pointed arch, that this more essential principle has been largely overlooked.

It was this necessity for concentration of thrusts that first led to the use of groin-ribs (for the groins of ordinary cross-vaults do not need supports where their thrusts are amply met by strength of walls or of massive piers), and it was this necessity which gave to Gothic vaulting that peculiar form which has puzzled so many students of architecture, who have not primarily regarded structural principles in their examinations and classifications of styles. I refer to that twisted conformation of the lateral cells of the vault which results from the stilting of the longitudinal rib. It is by means of this elevation of the springing of the end ribs of these lateral cells that the completest possible concentration of the vault-thrusts against the narrow pier is effected, and the full efficiency of the flying buttress is secured.

Now I think I am justified in saying that this is the most fundamental peculiarity of Gothic building, for everything else that distinguishes the system results from it. This balanced system being, then, what fundamentally distinguishes the Gothic style, let us now consider what were its antecedents, what class of earlier buildings really contained the germs of Gothic. It is commonly said that the Gothic was developed out of the Romanesque, though this development has been largely regarded as ornamental. The transition has been traced by nearly all writers, from De Caumont to Sharpe, through mouldings, pointed arches and other small features, while but a few writers—I believe only Viollet-le-Duc and Quicherat—have recognised that it is essentially structural.

It is true that structurally the Gothic is an evolution out of the Romanesque. But the term "Romanesque" has, perhaps, the widest meaning of any that is used in connection with architecture. In utmost strictness the Romanesque is not a style. It is an architecture of transition. Quicherat defines it as that which has ceased to be Roman and has not yet become Gothic. With slight modification this is a good definition. The modification that I should make would be to insert the word strictly before Roman, so that the definition would be :—"Romanesque architecture is that which has ceased to be strictly Roman and has not yet become Gothic." For the

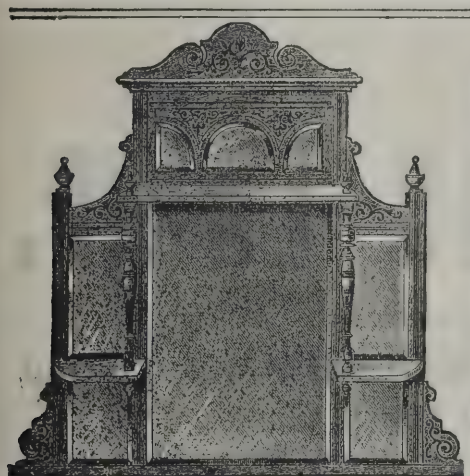
Romanesque is structurally Roman except in so far as it exhibits features that are tending towards Gothic. To comprehensively designate this transitional architecture, the term "Romanesque" is a good one for which it would be hard to find a substitute. But in connection with the origin of Gothic we need to discriminate. For when we look for the structural antecedents of Gothic we find that some great classes of Romanesque buildings exhibit them so slightly and imperfectly that they can hardly be regarded as antecedents at all.

In general what is known as basilical Romanesque, buildings like the cathedral of Pisa, had almost nothing to do with the structural evolution of the Gothic style. In its most general form the basilica does, of course, foreshadow the Gothic, and, as regards this general form, it may be considered as a prototype. But in its constructive system the basilica contained almost no element of growth. Its timber-roof called for no system of supports such as could in any way suggest the organic Gothic system.

It may, indeed, be said that some of the antecedents of Gothic reach back to those few Christian Roman monuments in some parts of which a rudimentary functional grouping of supports occurs. The first and most important instance of such a grouping that I know of is that which appears in the so-called basilica of Maxentius in the Roman Forum. This building dates from the beginning of the fourth century, and it followed closely after the well-known arcade of the court of the Palace of Diocletian at Spalato. As that is the first known instance of the logical use of the arch in connection with the columns, so, I believe, this basilica of Maxentius exhibits the first instance of a groined vault springing from columns placed in front of the piers, unless the great hall of the Baths of Caracalla may have exhibited a similar arrangement at a preceding date. It will be remembered that this system presents a pier carrying the main archivolts with a detached column, surmounted by a strip of entablature, to carry the vaulting; something remotely foreshadowing the Mediæval grouped support is thus to be noted as far back as this.



But nothing appears to have grown out of this monument in the way of the development of an organic system of supports for vaulting. It was constructed towards the end of what may be called the period of Imperial Roman art, and the Christian Roman builders, as is well known, employed the timber-roofed basilica with the simplest forms of superposed colonnades and arcades, having no organic connection with each other; in no feature, except perhaps the pier of the Eastern arch —which sometimes has a column in front of it—suggesting anything in the least like the Gothic forms.

The coupling of shafts, as in some of the Roman circular buildings, like Sta. Constanza at Rome, has far less to do with the development of Gothic, for such grouping has no structural significance. Its columns have no relation respectively to different parts of the superstructure. In the Roman buildings of Central Syria an arrangement similar to that of the basilica of Maxentius occasionally occurs, though not in connection with vaulting. In the church of Roueiha, dating from the sixth century, engaged piers, carrying transverse arches, are incorporated with the piers of the great arcade, and the same thing occurs in the piers of the apse of the church of Tourmain, but the principle is not developed into a system, and it is always confined, as it is also in the basilica of Maxentius, to a single storey.

A very remote suggestion of a functional grouping of piers, extending over two storeys of arcading, occurs in the supports of the central dome of the church of St. Sophia at Constantinople. And it is not impossible that something like this, which is not uncommon in Byzantine design, may have given the initiative to the early Mediæval builders.

The first true instances of grouped supports designed to carry vaulting and embracing several storeys occur in the eleventh-century churches of Northern Italy, in the style known as the Lombard Romanesque. In this region the vigorous genius of the Lombard race had stimulated invention and developed constructive ideas and methods which largely superseded those of former times.

The Lombard constructive system, as exhibited in its most important monument—St. Michèle of Pavia—was a radical innovation. The vaulting of the nave of this building was originally quadripartite in square compartments, like that of the basilica of Maxentius. It was furnished with heavy transverse ribs of two orders, both of square section, and it presented the first known instance of the use of groin ribs and longitudinal ribs. The sustaining pier is compounded of as many members, which rise from the pavement, and are crowned with a compound capital that furnishes a separate member for each vaulting-rib. The vault compartments of the aisles have but half the space of those of the nave, which necessitates the insertion of an intermediate pier. This pier has four engaged shafts, two of which carry the sub-orders of the archivolts (which are in two orders), one to carry the intermediate transverse rib of the aisle vault, and one on the side of the nave which rises to the triforium-string but carries nothing,

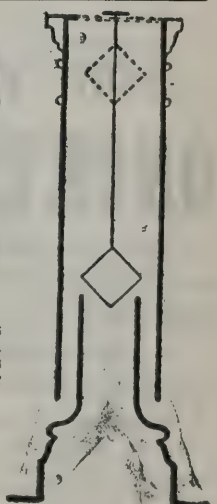
"CLIMAX" VENTILATING CO.'S

DIRECT ACTING

CHIMNEY COWL,



For the Preventing a Blow-down.

This Cowl is specially designed for preventing a blow-down and assisting the up-draught. It is admittedly the most efficient in the market. Its construction is scientifically and mathematically correct, and no matter from what direction the wind strikes it, a powerful upward current is established. It is noiseless, has no movable parts to get out of order, is easily cleaned, the cone over inner shaft being made to push up. It has THE very decided advantage over every other Cowl, IT IS SIGHTLY.

PRICES AND PARTICULARS ON APPLICATION.

THE "CLIMAX" VENTILATING CO.,

15 GREAT GEORGE STREET WESTMINSTER, S.W.

and is the only member in the system which is not perfectly logical. The double archivolts of the main arcade are supported by square members and engaged shafts in both main and intermediate piers. The church has also a triforium gallery, with double archivolts and functional supports. The building shows a most remarkable advance on anything that we know of that had gone before it. Indeed the Gothic system is here very fully foreshadowed, though radical changes had to take place in the forms of the vaulting before it could be further developed.

This Lombard system was carried over the Alps into Germany, and there in the twelfth century crystallised, so to speak, into the magnificent Rhenish Romanesque, which, by maintaining the square vaulting compartment, precluded any structural growth. It was the Lombard Romanesque, then, and its derivatives which contained the first distinct germs of the Gothic style. But these germs could not develop without congenial soil. The soil of Northern Italy was not congenial. Here by the twelfth century inventive vigour was spent. The Lombard element had been absorbed, and the Italian genius began to reassert itself with all of its conservative tendencies. The Italian constructive traditions were fundamentally Roman, and hence the basilical idea was, in church building, largely reinstated, though some of the Lombard principles were, in some localities, often incorporated with it, though without any inventive results.

The soil of Germany proved equally uncongenial. The German builders were slow in invention and almost as conservative as the Italians of acquirements that suited their needs and tastes. But France was, in the eleventh and twelfth centuries, the region of the most active intellectual life that then existed anywhere in Europe. And it was the Romanesque of France, and of France only, that directly gave rise to the wonderful development known as Gothic architecture.

But the Romanesque in France assumed a variety of forms, not all of which were found with the germs of Gothic. The French Romanesque is broadly of two classes, which occupy respectively the two principal geographical divisions of the country—the northern and southern. The Romanesque of Southern France is mainly characterised by the use of the barrel vault of either round or pointed section—a form which did not suggest, and was not capable of, any further development. This form of vault was but a survival of the Imperial Roman system, in a region which had maintained longer than any other the ancient civilisation and traditions.

Buildings like St. Trophine, St. Gilles and Vésone, though magnificent in their way, were, as regards their vaulting, but a final effervescence of an obsolete system. And although their builders adopted the Lombard grouped pier, variously modified, yet functionally adjusted to the arches and ribs with which their vaults were strengthened, they had not used these borrowed forms inventively; and in this class of monuments could, therefore, contribute nothing towards the development of a new art. Hence no new art arose in this region, or in any other, as a result of their influence.

But in the north of France—where ancient monuments had been fewer, ancient traditions less authoritative, and where the fusion of races had been more complete and better balanced—imagination had been highly stimulated, and new constructive forms that were quick with potent energy began early to appear. The use of vaulting did not set in here as early as in the south. The northern Romanesque builders of the eleventh century usually covered their naves with timber roofs. But when repeated disasters from fire had demonstrated the necessity of resort to vaulting, the fecund groined form was invariably adopted, which, over the rectangular compartments that had prevailed in this region, led, in the hands of these energetic and ingenious people, to a series of experimental innovations which followed each other in rapid succession until the Gothic system was reached.

There were here several centres of Romanesque inventive activity, each of which seems to have contributed something to the development of the chief school which soon became that of the Ile-de-France. These were mainly Burgundy on the one side and Normandy on the other. The Burgundian Romanesque is fully exemplified in the nave of the abbey church of Vézelay (twelfth century). It exhibits a modified application of the Lombard system to a building of narrow bays, giving rectangular instead of square vaulting compartments. This form is generally regarded as derived from the basilical type of buildings, but it seems to me that the intermediate pier of the Lombard type may naturally have suggested it.

However that may be, the piers are all alike, and are composed of members having a perfectly functional adjustment to the vaults and arches. Though showing an advance on the vaults of St. Michèle in being constructed over oblong compartments, these vaults of Vézelay are less advanced as regards their rib systems, for they are not provided with diagonal ribs. And it is interesting to note that the pier is correspondingly simplified, the member which, in St. Michèle, carries the

ON VIEW, AT 48 QUEEN VICTORIA STREET, E.C.,

ONCKEN PATENT STAVELESS BARRELS.

This remarkable invention, which enables Barrels to be made in One Piece by a New Process, has excited the greatest interest among Engineers, Coopers and others in England and the Continent; 20 per Cent. Economy in Wood and 50 per Cent. in labour.

An influential Company is being formed for working the invention, Prospectuses of which will be forwarded when ready, upon receipt of Name and Address, by the undersigned.

Barrels, Tubs, and other Articles, can be seen daily between Ten and Five o'clock.

48 Queen Victoria Street: November 1891.

ARTHUR L. FOLEY,
SECRETARY (pro tem).

diagonal rib, being omitted. But the system is perfectly logical as far as it goes. The vaults have heavy transverse ribs, and wall ribs, the former being of two orders. The first order is carried by a broad pilaster starting from the pavement, while the sub-order rests on an engaged shaft, also rising from the pavement. The wall ribs are supported by short pilasters resting on the triforium ledge. The double archivolts of the lower arcade are sustained, as in St. Michèle, on square members and engaged shafts.

The triforium space is low, and without openings—a simplification of the Lombard type that is common in the Rhenish as well as in the Burgundian Romanesque churches. This building, though constructed essentially on the Romanesque inert principles, nevertheless contains internally, as we see in rudimentary form, nearly all the constructive features of a Gothic edifice.

Some recent writers have supposed that the Cistercian order of monks were instrumental in developing and extending the early Gothic system. The learned German writer, Dehio, has lately published an essay on the "Beginnings of Gothic," in which he takes the Cistercian churches of Pontigny, in Burgundy, and Fossanora, in Italy, as types of transitional building and as important monuments illustrating early Gothic developments. But neither of these buildings show the initial principles of the new style. And if they did it would not show that Cistercian influence had much to do with the formation of Gothic, for these, as regards their Gothic features, are exceptional buildings, though in essential constructive principle they belong strictly to the Burgundian Romanesque category. The Cistercians had no consistent modes of building. They adopted different forms according to circumstances, in some cases, as at Hautrive, employing the barrel-vault, in others, as at Pontigny, imitating the features that had been developed in the Ile-de-France.

The typical Romanesque of Normandy is earlier than that of Burgundy, the existing church of St. Stephen, at Caen, dating its foundations from the year 1066. It is a more direct copy, though much modified and simplified, of St. Michèle, of Pavia. Whether this building was originally designed for vaulting is not known. But it is certain that it was first completed with a timber roof. Its main piers are, however, compounded of members corresponding to those of the Lombard pier, and they are well adjusted to the vaulting with which the timber roof was replaced early in the twelfth century. This vaulting is of a form that had not before, so far as is known, been constructed. It is primarily a modification of the square-groined vault resulting from the insertion of an intermediate transverse rib which subdivides the lateral cells, making the compartment sexpartite. Instead of converting the Lombard intermediate pier of the ground storey into a complete pier precisely like the main piers, thus producing narrow or rectangular vault compartments as at Vézelay, the builders of Caen merely prolonged the intermediate vaulting-shaft to support the intermediate rib. In all other respects the system conforms to that of St. Michèle, except in its proportions, which are much elongated in the manner that subsequently prevailed in the north.

The sexpartite vault system, which apparently originated at Caen, was immediately taken up and perfected by the early Gothic builders of the Ile-de-France; but it is not true, as is often affirmed, that it was exclusively used in early Gothic buildings. The vaults of Caen have a full system of ribs with exception of wall-ribs. As yet the Romanesque developments tending toward Gothic were mainly confined to the interior of the structure. But a first step in the direction of a corresponding external system was taken when pilaster strips began to assume the form of projecting buttresses, and the germ of the true flying buttress appears, I believe, for the first time in the arches that are thrown against the piers under the roof of the aisles on the sister church to St. Stephen, the Abbaye aux Dames at Caen.

The Romanesque of the Ile-de-France was almost all destroyed in the twelfth century by the active rebuilding in the new style which then prevailed. A few monuments of moderate dimensions remain, however, from which a general idea of it is obtained—Morienval and St. Germain des Près. The square compartment was generally abandoned and the rectangular form substituted. This was, I think, a circumstance of capital importance, giving rise, as it did, to difficulties in vaulting which quickened the inventive genius of the builders.

The abbey church of Morienval is the most important existing monument as regards the direct antecedents of the Gothic style. It is a plain Romanesque building dating from the eleventh century, with a reconstructed apse dating apparently from the end of that century. Here we get, on a very small scale, a rudimentary apsidal aisle of four compartments, in whose vaults the groin rib occurs in connection with some very curious experiments in the use of the pointed arch. It is, I believe, the earliest monument in existence in which these two features are associated, and it was apparently the starting-point

BRICK AND TILE MATERIALS.

THE important manufacturing business carried on by the Sneyd Colliery and Brickworks Company, Limited, of Burslem, has under the last five years been thoroughly reorganised, under the able superintendence of Mr. S. Webster Dean. The manufacture of glazed bricks, coloured as well as white, is an extensive branch of business with the company, the special points aimed at being the manufacture of a brick that is indestructible by natural influences or natural forces, that is, a brick that is impervious to the usual destructive agencies of weather, climate, &c., and one that can resist the heaviest pressure that would be brought to bear on it as a building material. The characteristics of a good glazed brick, Mr. Dean lays down, are the firm adherence of the enamel to the body of the brick; the capability of that body to resist a heavy pressure and thus prevent the edges of the bricks chipping or flying when subject to such pressure, another point being purity of the enamel. Mr. Webster Dean has devoted much time and exhaustive study to the composition and preparation of the various enamels, all those used being his own. The mixing and preparation of glazes and enamels being often, he says, committed to men employed for the purpose, if a firm loses their "glazeman," they, knowing nothing whatever of their composition, are hampered by the change from one composition to another, a change in many cases for the worse. That these important points are secured seems evidenced by the buildings wherein they have been used. Among other contracts in which they have been used are the following:—Windsor Castle and the New Post Office Buildings, London, by H.M. Commissioner of Works; the new Law Courts; the Tivoli Restaurant, Strand, W.C., by Mr. Walter Emden; the new stores in Huish Court and Water Lane, Blackfriars, E.C., for Messrs. Spiers & Pond, Limited (this building is faced outside with coloured glazed bricks and lined with white), by Messrs. Hargreaves & Matear; by railway engineers, &c. The bricks, which are fireproof, are manufactured from carefully-picked fireclay of the purest quality. Great care is taken in every process of the manufacture. They are burnt at white heat, thus welding the enamel inseparably with the brick.

There are two sizes of bricks, viz. 9 by 4½ by 2⅞ and 9 by 4½ by 3½, always in stock at the works in all ordinary kinds, and all shapes of the 9 by 4½ by 2⅞ size in stock at the London depôt. Special shapes and colours are made to order on reasonable notice being given. All are well adapted for lining dairies, kitchens, subways, cellars and basements, lavatories, urinals, and any other position where light and cleanliness are items of the first consideration. For stables, coach-houses, kennels, &c., the salt-glazed bricks made by this company are recommended as much cheaper and equally durable, while for special work, interior and exterior, there are the white or coloured glazed bricks. The company are also manufacturers of a specialty in the shape of their Burslem indestructible glazed bricks, which are of a warm stone colour and are much cheaper than the coloured enamelled bricks, and much used for Board schools, stables, cellars, &c. Attention may also be called to a new list of fire-tiles, fire-lumps and quarries which the company have in stock at the St. Pancras depôt, St. Pancras Goods Station, Euston Road. The London offices of the company are at 23 Bartlett's Buildings, Holborn Circus, E.C.

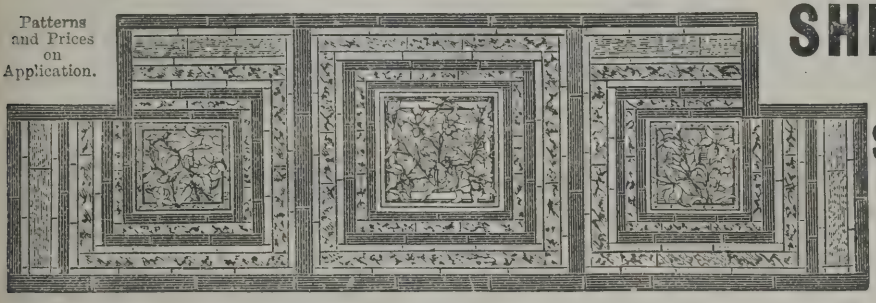
that the edges of the glass only come in contact with the flesh, so avoiding any dirtying of the surfaces of the glass.

SCHOOL BUILDING.

A MEETING of the Architectural Section of the Philosophical Society of Glasgow was held on Monday in the rooms, Bath Street, at which Mr. John M'Math, Glasgow School Board Master of Works, read a paper on "The Progress of School Buildings since 1873." In the course of his paper Mr. M'Math surveyed the architectural development of the various educational edifices which have been raised in our city under the administration of the School Board during the eighteen years which have elapsed since the Education Act came into force. While he remarked the development in intellectual force and culture in the time alluded to had been brilliant in the extreme, the progress made with reference to our educational buildings, not only as regards comfort and attention to the laws of health, but also in relation to architectural beauty, had been a feature worthy of the sincerest congratulation. When we considered the splendid structures we now had as educational institutions in our city, it was alike natural and graceful that we should gratefully recognise the able work performed by the first School Board which Glasgow appointed in 1873, immediately after the Education Act came into force. To the firmly representative character, the strong individuality, and the fine administrative power of the Board we owe much in the way of laying down an enlightened, firm policy, which subsequent Boards had in a large measure followed. Mr. M'Math afterwards went into detail on the subject of his paper. He was awarded at its close a cordial vote of thanks.



THE MANCHESTER SHIP CANAL.

THE discovery that the cost of completing the works of the Manchester Ship Canal was under-estimated has caused consternation. It is not impossible that a further outlay of a million will be needed. The representatives of the Manchester Corporation have demanded further investigations, and consider it is unwise for the company to dispense with the experience and ability of contractors. The following explanation has been offered by the chairman of the company, Lord Egerton of Tatton :—

The two reports of the sub-committee agree generally as to the facts, and point substantially to the same conclusions, viz. economy of resources, and the opening of the waterway to Manchester as early as possible with the funds at the disposal of the company. I heartily concur with the regret expressed by the Corporation directors that the estimates presented by the two engineers in January last should, owing to unforeseen difficulties, have been substantially augmented, and the forecast of expenditure so largely exceeded, as appears by the report of the sub-committee. Their report, which is carefully drawn up, shows that this large discrepancy from the previous estimates is mainly composed of fresh items of cost which have arisen from various causes beyond the control of the Board, and which could not accurately have been foreseen with the knowledge at our disposal, rather than from the increase of expenditure over the contract prices for the ordinary works of the canal.

The extraordinary prices have been made up of the following items, which may be summarised as follows :—1. The extra cost of finishing and cleaning up the sections between Eastham and the mouth of the Weaver, not included specially in the contract prices, and which would have fallen upon the contractor. 2. The effects of frost and flood in disintegrating the banks and causing heavy deposits of silt in the cuttings have been far greater than could have been anticipated in

VOLUME XLV. OF THE ARCHITECT
Handsomely bound in Cloth, Gilt Lettered, price 12s.6d.
Office: 175 Strand, London, E.C.

January last, when the frost was still in the ground and the canal for several miles was filled with water. 3. The necessity for flattening the slopes and the purchase of land for that purpose in many places could not, from the previous experience of the last two years, have in all cases been anticipated. 4. A large portion of the rock, which promised from the borings to be sound, has turned out to be worthless for masonry or even pitching. 5. In consequence of the excessive rain and floods during the summer months the dredging has been much slower and more expensive.

The Board is also aware that not only up to the end of January last, but even up to March, the changes consequent on the death of the contractor, combined with the disastrous weather already alluded to, greatly retarded the general progress of the work and added to the expense. The double set of officials on the contractor's and company's staff have since that time been reduced as far as seemed consistent with the efficiency of the work. From May last, and since the passing of the Bill through Parliament, which occupied a large portion of the directors' time during the summer months, the Board have narrowly scrutinised their expenditure and checked it by an elaborate system of returns, both from the engineer and Mr. Topham. The Board have also endeavoured to do as much as possible all work by piecework or by contract, and I do not believe there has been any want of economy proved in the purchase of stores. The agents of the company have followed the plan adopted by the late Mr. Walker after his great experience of contracts, and where practicable, the prices have been settled by competition.

I trust that the suggestions made by the sub-committee and the Corporation directors may be fairly considered by the Board, as I believe nothing is further from their wish than to spend any more money upon the canal than is absolutely necessary for its completion at as early a date as possible and in the most substantial way.

The report of the sub-committee and the separate pronouncement signed by Alderman Sir John Harwood and Councillor Southern having been considered, it was resolved that the report of the sub-committee be adopted and that the following statement be placed on record :—

The Board also express extreme regret that the increase in the quantities of work done and to be done should add so much to the estimate of January 1, 1891. Some of the work might perhaps have been foreseen by the company's engineers, but it is only fair to record that when that estimate was prepared the cuttings between Manchester and Warrington were more or less full of flood water, and that it was therefore difficult to estimate the amount of extra work caused by the floods. The engineers could also hardly be expected to foreknow that the stone in so many of the cuttings would not only prove to be worthless, but so soft as to necessitate very heavy expenditure in brickwork in order to prevent the sides of the cuttings from falling into the canal. The landslips and silting have been much more serious, too, than might reasonably have been expected. Delay is one of the most expensive items, and the opening of the section from Ellesmere Port to the Weaver was delayed nearly two months by the costly necessity of facing with brickwork some portions of the rock sides of the canal, which, though hard when excavated, subsequently became rotten and soft, of repairing landslips and of driving piles to prevent further slips where the soil was found, as the excavation proceeded, to be as treacherous as quicksand. The onerous clauses imposed upon the company in the Act of 1885 have continued to be a source of anxiety, delay and expense ; but the great bulk of the difficulties thus arising are now, happily, overcome. Hitherto the progress of the work has, however, been hampered and delayed by those severe conditions to an extent that was probably never expected by those who had to accept them to secure the passing of the Act.

The Board have never lost sight of the necessity of exercising the strictest economy. The reduction of the number of the officials engaged in carrying out the works, who were all taken over from the contractor by the company for the purpose of securing efficient control over the works, has been a matter of frequent and anxious consideration, and large reductions have been made from time to time as portions of the works were completed. As lately as last week a further reduction was ordered that will lessen the salary list by 2,725*l.* per annum, and the Board see that other larger savings will soon be feasible without prejudicing the progress of the works, although a work of such magnitude will until its completion require a number of experienced, highly-paid men as organisers and supervisors. All the agreements give the Board power, however, to terminate them on short notice, and reductions can therefore be speedily effected whenever they are seen to be safe and desirable.

A large decrease in the expenditure on workshops has been effected since the opening of the canal from Eastham to the Weaver (10½ miles), and a further reorganisation is now or will shortly be practicable. It has been a standing order and the persistent policy of the Board to adopt piecework to the utmost

possible extent, and they cordially welcome any suggestions that will enable them further to substitute piecework for day-work. The Board are ready to let any portion of the work by public tenders where, in the opinion of the company's engineer and the Corporation engineer, there would be no risk of the contractor hampering or delaying the adjoining work, or interfering with the working of the railways, or of disputes arising that might lead to costly arbitrations. The Board place, however, on record the fact that the increased estimate is mainly caused by larger quantities of work having to be done, and stone having to be bought, and that only a comparatively small increase arises from enhanced prices. When the 10 per cent. for contingencies was added to the January estimate, the chief contingency in the minds of the Board was the possibility of the prices proving to be in excess of those calculated upon. The increased prices now calculated absorb a considerable portion of the 10 per cent.

Some of the difficulties inseparable from the letting of portions of the work are set forth in the following extract from the report of the Corporation engineer to the Corporation, dated February 28, 1891 :—"I fear it would be difficult to rearrange the work with a view of reletting it in sections for completion, in consequence of the interlacing and dependence in some cases of one portion of the work upon another, and as to the distribution of the plant ; further, it is doubtful whether any real advantage would be gained by this in the present state of the work, owing to the loss of time in arranging the contracts and in reletting the work. I have, therefore, concluded that it will be best to continue the work by administration. Under this system, much of the work to be done may still be let piecework, by which many of the advantages of contract work would be obtained."

Arrangements have already been made for the purchase of all materials and stores upon publicly invited competition only.

The Board have to keep constantly before them, when discussing reductions in expenditure, the fact that time is almost the most essential element in all the calculations pertaining to the cost of the works. The cost of every working day's delay, measured in actual payment of money for interest and fixed charges, leaving out of consideration the fact that 8,000,000*l.* of shareholders' capital expended on the work will be idle until the canal is opened, is 1,000*l.* sterling.

The report of the Ship Canal Committee of the Manchester Corporation states that the committee have received no satisfactory explanation of the fact that, whereas in January last a certain amount was affirmed to be adequate to complete the canal, it is now stated by the engineers of the company that a further sum of 863,595*l.* will be necessary. It goes on to say :—"We consider that a grave responsibility exists as to the estimates upon which the Corporation acted in their decision to render financial help, and would like to see this responsibility fixed." They do not doubt that large room exists for retrenchment in the conduct of the enterprise, and they emphatically endorse the suggestions made by their representatives. Considering the position in which the enterprise stands, they think there should be such arrangements made by the Board as would give more ready effect to any suggestions the Corporation directors may find it their duty to make. The committee regret that an earlier recognition was not made by the Ship Canal Board of the views of the Corporation representatives, and that the company's representatives have arrived only at a tardy recognition of the advantages of purchases by tender. Although a statement appears in the report to the effect that the directors are prepared to purchase by tender, as a matter of fact no such purchases have up to this date been made. The committee record their confidence in the commercial success of the undertaking, and are gratified to note that in neither of the reports placed before them does any doubt on this point find expression.

The decision of the City Council on the subject will be given at the next meeting.

PRIVATE BILLS IN PARLIAMENT.

THE time for giving official notice of all Private Bills that will be brought forward next session and of all Provisional Orders for which application is about to be made to the Board of Trade, has now expired. From the notices thus given it is found that the total number of Private Bills proposed to be introduced into Parliament next year is only 188, and the total number of Provisional Orders that will be applied for is not greater than 69. Of the total number of Private Bills 81 relate to railways, docks and canals ; 33 to gas, water and electric lighting undertakings; 21 are Corporation and Local Board Improvement Bills ; 11 relate to tramways ; and the remainder are of a miscellaneous character, among which is included the Channel Tunnel Bill, which will again be brought forward. No fewer than 24 of the total number of Private Bills relate directly to London, among which are two projected railways from Waterloo to the

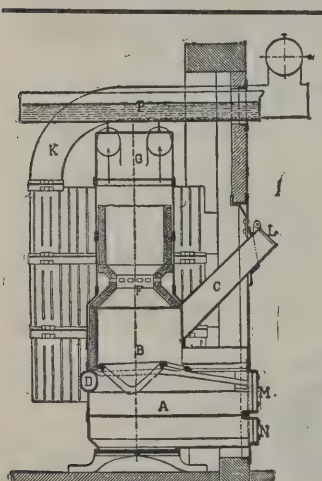
City, a line from Waterloo to Baker Street, and another projected line from Charing Cross to St. Pancras and Hampstead. The existing or authorised electrical railway companies are also promoting extensions from King William Street to Islington, and from the Royal Exchange to Liverpool Street; whilst other lines are proposed from Finsbury Park Station to the City and from the City to Epping Forest. The London County Council are responsible for four Bills, namely, their General Powers Bill, a Bill for the construction by them of tramways over Westminster Bridge to Charing Cross, a Bill for the construction of subways for the reception of gas, water and other pipes, and a Bill dealing with the London water supply, the expense of promoting which will, in the event of failure, be paid by the Corporation of London. Of the total number of provisional orders 30 relate to electric lighting, 16 to gas and water companies, 13 to piers and harbours, and 10 to tramways. Of the electric lighting orders 13 are for powers to light certain areas in London which are already allocated to other companies under Provisional Orders confirmed by Parliament in past sessions.



PENALTIES IN CONTRACTS.

THE appeal of the plaintiff, Mr. George Law, contractor, in the case Law *v.* Local Board of Redditch, was heard before the Master of the Rolls, Lord Justice Lopes and Lord Justice Kay. The action was brought to recover 834*l.* 7*s.* 1*d.* for work done and materials supplied. By a contract and specification dated February 27, 1889, the plaintiff undertook to do certain drainage works for the defendants. The contract contained the following provision:—"The works shall be completed in all respects and cleared of all implements, tackle, impediments and rubbish on or before April 30, 1889, to the satisfaction of the surveyor, to be testified by a certificate under his hand, and in default of such completion the contractor shall forfeit and pay to the urban authority the sum of 100*l.* and 5*l.* for every seven days during which the works shall be incomplete after the said time, and the sums so forfeited may be recovered by the urban authority from the contractor as and for liquidated damages." In the specification there was the following proviso:—"The whole of the works herein specified, together with any extra works, shall be completed within a period of two months and three days, dating from the signing of the contract, and if the contractor fail to complete the works in the specified time he shall forfeit the penal sum of 100*l.* and a further sum of 5*l.* for each and every week during which time the contract remains incomplete after the specified time, and in addition to these fines he shall pay the extra time of the clerk of the works employed in superintending the works, all of which penalties or charges shall be deducted from any moneys that may be or become due to the contractor or his sureties or shall be recoverable from them." It was agreed between the parties that all disputes between them touching any alterations, additions or omissions should be referred to the Board's surveyor, Mr. Stephen Elgar Thorrold, his award to be final and conclusive, and Mr. Thorrold had found that the plaintiff was entitled to receive 499*l.* 13*s.* 4*d.* The defendants denied that more than the amount of the surveyor's award was due to the plaintiff for extra works, and they claimed in penalties 160*l.*, because the plaintiff had neglected to complete the contract by the stipulated time, April 30, 1889, to the satisfaction of the surveyor, whereas there was a delay beyond that time up to July 30. The defendants had paid 399*l.* 13*s.* 4*d.* into Court as sufficient to satisfy the plaintiff's claim, and they counter-claimed for 100*l.*, the amount of two claims brought against them, and which they had been compelled to pay, in respect of loss and damage to property from the neglect of the plaintiff's workmen during the execution of the works of the contract. At the trial Mr. Justice Hawkins found for the defendants; hence the present appeal.

For the appellant, it was contended that the provisions created a penalty and not liquidated damages. The sums of 100*l.* and 5*l.* per week could not, therefore, be recovered as a whole, but only the damage actually suffered by the defendants in consequence of the delay.

The Master of the Rolls said that it was unnecessary to go through all the cases on the subject. There was one canon of construction as to which all the decisions agreed. When the parties to a contract had agreed that in case of one of the parties doing or omitting to do some one thing he should pay a specific sum, that sum would be construed by the Courts to be liquidated damages and not a penalty. The only exception was where it was agreed that a large sum should be paid in respect of the nonpayment of a smaller sum; in that case the Courts would consider that the large sum was a penalty and not liquidated damages. If the sum were agreed to be paid in respect of any of several events, some of which might produce inconsiderable damage, then the Courts might hold it to be a penalty, and might not suffer more to be recovered than the

damage actually caused by the breach. But where the payment depended on one event, and one event only (not being the non-payment of money), then the sum payable had always been construed as liquidated damages, assessed by the parties to the contract. That made it necessary to interpret the contract in this case. In his opinion it was quite clear that two different things were spoken of—the completion of the works and the clearing them from rubbish, &c. The sum of 100*l.* and the 5*l.* per week were made payable if the completion—not the clearing—did not take place on a certain day. That, therefore, was one event, and the sum was payable as liquidated damages. Even if the clearing away of the rubbish was included in the completion that only made it one event, and as that event had not taken place on the fixed day, the whole sum fixed became payable as liquidated damages which had been assessed by the parties.

Lords Justice Lopes and Kay concurred, the latter stating that the terms of the contract were purposely worded to prevent the litigation that took place in the Equity Courts to recover penalties for non-performance. The sums stated in the contract were the payments to be made in the nature of liquidated damages if the works were not completed by the agreed time.

The appeal was then dismissed, with costs.

BUILDERS' BENEVOLENT INSTITUTION.

AN election of one female pensioner on the funds of this Institution was held at the offices, 35 Southampton Row, Bloomsbury Square, on Thursday, the 26th ult., Mr B. E. Nightingale, president, in the chair. There were four candidates for the vacancy. Shortly after the close of the poll the scrutineers, Messrs. T. Stirling and Ernest Rider, announced the result of the polling to be as follows:—Margaret Alice Richardson, Preston, North Shields, aged 66, widow of T. B. Richardson, late of Bayswater, builder (sixth application), 2,655 votes; Mary Ann Shapland, 132 Stamford Street, Lambeth, aged 71, widow of William Shapland, builder (fifth application), 3,294 votes; Sarah Elizabeth Drake, Tylers and Bricklayers' Almshouses, King Henry's Walk, Ball's Pond, widow of Francis Drake, late of Acton, builder (second application), 1,339 votes; and Susanna Mansell, 20 Bridge Road, Hammersmith, aged 68, widow of William Mansell, builder (first application), 806 votes. The successful candidate was therefore declared to be Mary Ann Shapland.

Among the friends of the Institution other than those already named who took part in the proceedings were Messrs. Geo. Plucknett, J.P., hon. treasurer; C. Bussell, J. T. Bolding, W. Scrivener, T. Hall and H. Ashby.

Votes of thanks to the Chairman and scrutineers closed the proceedings.

APPLICATIONS FOR PATENTS.

19827. Samuel Benjamin Wilkins, for "Improvements in the construction of fireproof doors, iron or steel shutters, fire-screens, safes, or fireproof-rooms."

19835. William Alfred Crook and Henry John Payne, for "Improvements in gravity control, as applied to electric measuring instruments."

19857. Frederick Rogers Lipscombe, for "Improvements in chimney cowls and cowls for ventilating shafts."

19869. Patrick Barry, for "Improvements in the covers of kitchen boilers."

19877. Curd Nube, for "Improvements in adjustable clamps for bench vices."

19887. Augustine McNerney, for "Improvements in and relating to the hanging of doors and shutters, whereby the closing of same may be rendered automatic without the aid of springs."

19910. Charles Knapp, for "Combined automatic sash lift and lock."

19947. Charles Joseph Crosby, for "An improved appliance for preventing down draught in chimney and other shafts."

19998. Henry Defries and Wolf Defries, for "Improvements in window frames."

20269. Ludwig Haarmann, for "Means for securing asphalte mastic as a coating or stopping upon all descriptions of buildings and building materials."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & CO., Patent Agents, 37 Chancery Lane, London, W.C.

VENTILATION.

CROSSLEY'S
GAS ENGINE
As Specially Adapted.

GAS CONSUMPTION,
4 h.p. Size, about 1·50 Pence per Million Cubic Feet of Air passed.

Represents 4 h.p. nominal, indicating 9½ h.p.

CROSSLEY'S
GAS ENGINES
In combination with the most improved ventilation systems renew the whole air of a building from four to six times per hour.

Full Particulars on application.

CROSSLEY BROS., LIM.
OPENSHAW, MANCHESTER.

CHICAGO CONSTRUCTION; OR, TALL BUILDINGS ON A COMPRESSIBLE SOIL.*

WHAT is now generally known as the Chicago Construction consists of a fireproofed steel skeleton, so arranged that all the load, including the walls and partitions, are carried storey by storey on the columns. The foundations, as far as practicable, are on isolated piers. Even before the Chicago fire, what is known as "foundation by isolated piers" had been accepted by the Chicago architects as the best adapted to their peculiar soil. Underlying Chicago is a bed of soft, compressible clay of great thickness, some 60 to 90 feet. This clay has one redeeming feature; it satisfies Professor Tyndall's definition of a solid: "under a given load it will compress a certain quantity and stop, and the compression will not be renewed without a change in the conditions." Experience teaches that a load of 3,000 pounds per square foot will cause a compression of about 2 inches, and that it is desirable not to materially increase this load or the compressions may not be sufficiently uniform. With 3,000 pounds per square foot, with proper care in the distribution of the loads, a practically uniform settlement can be obtained with reasonable certainty.

As early as 1873 Mr. Fred. Baumann, one of Chicago's oldest architects, had published a little pamphlet on isolated piers and their adaptability to Chicago foundations. The advantages of a system of isolated piers on a compressible soil is its elasticity, it being impracticable during the construction of a building to keep a uniform load on the foundations: hence the necessity of allowing the parts to settle at different times, counting upon a general uniformity of settlement in the end. A continuous foundation is liable to be broken up and very unequally; therefore even when the pier-foundations touch each other they are kept separate by plank or sheet piling on the line of junction.

In 1883 the writer was requested by orders received from the officers of the Home Insurance Company of New York to prepare designs for a ten-storey fireproof office building to be erected in Chicago—dimensions 100 by 135 feet—on the corner of La Salle and Adam Streets, the principal storey to be arranged for two great banks or kindred use, while all the storeys above should be divided into small offices, all of which must be well lighted. These requirements when coupled with the condition of a very compressible soil, carrying only a light load per square foot, necessitated a different method of construction from those in general use. The piers must be narrow in order that proper space might be left for windows; the walls must not be as heavy as the old construction would demand, or there would not be sufficient space on the ground for the foundations. A column in each pier was the natural solution of the problem. Lintels between columns, forming heads of windows, carried the street walls storey by storey; the brickwork was reduced to the thickness necessary to hold the window-frames or to fireproof the metal columns and lintels. The method of construction has been improved upon; each architect using it has added something, particularly to the details. The manufacturers of steel, terra-cotta and fireproofing have improved their material and adapted it more especially to this style of construction, so that I have selected one of the late buildings—a building now under construction known as the Fair, occupying a half block on Dearborn, Adams and State, 400 by 160 and seventeen storeys—241 feet—high above the sidewalk.

Rolled steel columns are in general use for these tall buildings, all connections being made with hot steel rivets, hence more rigidity as against wind pressure and vibrations of moving loads, like running machinery, than can be obtained with the cast columns and screw-bolt connections. Where so much depends upon the columns every precaution against accidents should be taken. The rolled steel column composed of several parts rivetted together, each part inspected separately both for quality of metal and for surface, and then the finished column inspected for workmanship, offers a guarantee against any serious failure far beyond what can be expected from a cast column as usually manufactured. In the Fair the Z-bar column is used. The plate and the brackets are rivetted together and the beams and girders are rivetted to the lower column through the plate and to the top column by an angle.

The wind-pressure must be looked after. The floors are, by the fireproof arches, made sufficiently rigid, but the columns may require bracing, either by knees, as in naval architecture, or by X-rods, as in bridge construction.

The construction of tall buildings on a compressible soil much resembles, in the generalities, the construction of a railway bridge of the first order. The design must be such that the material is used in the most economical manner; every piece must be calculated. There must be sufficient material and no more, for it is essential, not only from economy but also to reduce the weights on the foundations, that the construction

Tender for Contracts for any Joiners' Work or Ornamental Plaster. Painting—Plain or Decorative.
Wrought-Iron Work. Stained Cathedral Glass, and any other Interior Work.

should be as light as possible, consistent with stability. To this end the live loads are provided for as nearly as practicable as they will actually occur.

The column loads in the Fair building are figured for the full dead loads, plus such a percentage of the live loads as will probably obtain :—

Column.	Live load which the beams in the storey above the respective column are calculated to carry.	Percentage of the sum of the live loads of all the storeys above the respective column.*
Attic column	40 lbs. per square foot	100 per cent.
16 storey column	75 " "	90 "
15 "	75 " "	87½ "
14 "	75 " "	77½ "
13 "	75 " "	75 "
12 "	75 " "	72½ "
11 "	75 " "	70 "
10 "	75 " "	67½ "
9 "	75 " "	65 "
8 "	75 " "	62½ "
7 "	75 " "	60 "
6 "	75 " "	57½ "
5 "	130 " "	55 "
4 "	200 " "	52½ "
3 "	130 " "	50 "
2 "	130 " "	47½ "
1 "	130 " "	45 "
Basement column	130 " "	42½ "

Floor-beams are calculated to the dead load, plus the full amount of the live load designated as the maximum load for said storey. The girders are calculated to carry all the dead load, plus 90 per cent. of the live load designated for said storey. These reductions are made to reduce the metal to the probabilities. Although a floor-beam may be loaded with the full designated amount per square foot of floor carried by said beam, such is not true of the girder, as certain spaces or passages must be left for the service. It is easy to see that the probable percentage of the total designated live loads on any given column diminishes as the number of storeys above said column increases. Footing-beams must be calculated to carry all the load of the basement column, plus the basement floor load that will rest upon them—often the important item of boilers, engines or dynamos.

The load on the clay is of great importance, or the settlement is unequal. It must be all the dead load plus so much of the live load as will actually come upon it. The live load on the clay depends upon the use to which the building is to be applied. In a hotel or office building the live load is so small in proportion to the dead load that it may be neglected in calculating the area of the supporting clay, particularly as this weight is not applied until the building has settled, that is, the compression of the clay has taken place.

Experience has shown that after the clay has been compressed by a weight of 3,000 lbs. per square foot, and allowed a few months of repose, no addition to that compression will obtain without a material addition to the load, so that it is good practice to neglect the live load on the clay in hotels, office buildings and light retail stores ; not so, however, in warehouses or other buildings carrying heavy floor loads, and particularly where there is running machinery ; these moving loads should be counted as double the actual weight, for the continuous jar has the effect of pounding and increases the compression of the clay.

The last addition to the tall buildings was the steel chimney. At the Fair there was no place for the foundations of a brick chimney stack such as was necessary for the battery of boilers sufficient to heat the buildings and run the elevators, electric light plant, house-pumps, &c. The external steel chimney had long been in use for manufactories—why not an internal steel chimney for an office building? This was found practical and economical. In these chimneys all the load is carried on the steel shell. Angles are rivetted on the interior each 20 feet or so, to carry the firebrick lining, and to avoid trouble from unequal expansion. The exterior is covered by plaster fireproofing resting on the floors. This covering hides the chimney and checks the radiation.

The material in these tall buildings is calculated so closely that the same rigid inspection is necessary as for a railway bridge. The specifications must be very full and explicit.

Tall steel buildings, constructed as described, are very substantial, and even earthquake-proof. The exterior can be almost entirely of glass, the windows separate only by the fireproof metal. The party walls may be, and usually are, carried storey by storey on the lintels supporting the floors ; the lintels carried on steel columns built in the thickness of the wall or projecting as fireproofed pilasters. This reduces the party wall to a uniform thickness in all storeys, say 12 or 16 inches. Hollow building tiles are often used for these walls, reducing the weight by nearly one-half.

* This percentage of live load, together with all the dead load, is the total load the respective column is calculated to carry.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the office, 175 Strand, London, W.C., not later than* 5 P.M. *on Thursdays.*

Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—"Contract Reporter to THE ARCHITECT."

COMPETITION OPEN.

BELFAST.—Jan. 1.—Competitive Plans are invited for a Hospital for Diseases of the Chest. Details can be had from Mr. F. Howard Sinclair, M.D., hon. sec. med. staff, 76 Pakenham Place, Belfast. Plans to be sent in in a sealed envelope, accompanied by a motto.

CONTRACTS OPEN.

BANFF.—Dec. 25.—For Works in Building Bank Office and Agent's House. Messrs. Wm. Henderson & Son, Architects, 124 Union Street, Aberdeen.

BATLEY.—Dec. 18.—For Building Four Dwelling-houses. Messrs. P. Spencer & Son, Architects, Batley Carr.

BEAUMARIS.—Dec. 21.—For Building Premises. Mr. R. G. Thomas, Architect, Menai Bridge.

BECKENHAM.—Dec. 14.—For Taking Down and Removing Trees. Mr. S. B. Carlton, Engineer, Local Board Offices, Beckenham.

BODIAM.—Dec. 31.—For Rebuilding Bodiam and Hammerditch Bridges. Mr. Henry Card, County Surveyor, Lewes.

BOURNEMOUTH.—Dec. 24.—For Lighting by Electricity the Pier, Pleasure Gardens and Municipal Buildings. Mr. F. W. Lacey, Borough Engineer, Town Hall Chambers, Bournemouth.

BRADFORD.—Dec. 16.—For Additions to House. Messrs. T. H. & F. Healey, Architects, Tyrrel Street, Bradford.

CARMARTHEN.—Dec. 28.—For Building Infant School and Alterations to Pentrepoth School.

CHATHAM.—Dec. 16.—For Erection of Engine-room and Other Buildings, for Electric Lighting Co. Mr. Betts, Architect, Medway Street, Chatham.

COLLINGHAM.—Dec. 16.—For Building Villa. Mr. C. F. Wilkinson, Architect, 35 Park Square, Leeds.

CROYDON.—Dec. 21.—For the Foundations and Substructure of New Municipal Buildings and Free Library to be Erected in Katharine Street, Croydon. Mr. C. Henman, Architect, 64 Cannon Street, E.C.

DUBLIN.—Jan. 1.—For Alterations to Mansion, Athgoe Park, Hazelhatch. Mr. Wm. H. Byrne, Architect, 20 Suffolk Street, Dublin.

EGREMONT.—Dec. 21.—For Building Church, Schools, Caretaker's House, Boundary Walls, &c. Mr. J. S. Moffatt, Architect, 53 Church Street, Whitehaven.

GUERNSEY.—Dec. 19.—For Building Secondary Schools. Mr. Frank Whitmore, Architect, Chelmsford.

HALIFAX.—Dec. 30.—For Building Store and Six Houses. Messrs. Horsfall & Williams, Architects, 15 George Street, Halifax.

HALIFAX.—Jan. 2.—For Building Shop Premises. Messrs. G. Buckley & Son, Architects, Tower Chambers, Halifax.

HINCKLEY.—Dec. 14.—For Additions to Workhouse. Mr. J. Ball, Architect, 20 Spring Gardens, Hinckley.

KENDAL.—Dec. 11.—For Enlarging Bridge Mills. Mr. Stephen Shaw, Architect, Kendal.

LEEDS.—Dec. 11.—For Building Stores and Three Through Houses. Mr. J. M. Fawcett, Secretary to the Industrial Co-operative Society, Limited, 10 Albion Street, Leeds.

LEEDS.—Dec. 16.—For Building Post Office. The Secretary, H.M. Office of Works, 12 Whitehall Place, S.W.

LEWISHAM.—Jan. 14.—For Building Infirmary. Messrs. A. & C. Harston, Architects, 15 Leadenhall Street, E.C.

LIVERPOOL.—Jan. 6.—For Building Workhouse Infirmary, &c. Messrs. C. O. Ellison & Son, Architects, 22 St. Thomas's Buildings, Liverpool.

LONDON.—Dec. 19.—For Supply of Paving Materials, Drain Pipes, Paint, Ironmongery, Castings, Timber, &c., for one year. Mr. G. Livingstone, Surveyor, 1 Pimlico Road. S.W.

MEDOMSLEY.—Dec. 19.—For Building Business and Manager's House. Mr. J. W. Rounthwaite, Architect, Blackhill, co. Durham.

OUSEBURN.—Dec. 16.—For Building Board School. Mr. F. W. Rich, Architect, 5 Eldon Square, Newcastle-on-Tyne.

ELECTRIC LIGHTING.

Arthur B. Gill & Co.

ELECTRIC LIGHT AND GENERAL ENGINEERS,

Showrooms :—36 PARLIAMENT STREET, WESTMINSTER, S.W.

VARIETIES.

THE *Canadian Architect* says:—The architect and decorator desirous of learning how to secure the most pleasing colour effects, might profitably have spent a few of the latter days of October in studying autumn foliage in its unusually varied and brilliant aspects.

THE same journal says:—The inspector of buildings and the chief of the Fire Brigade have recently been engaged in making an examination of the public buildings of Toronto, with a view to determining whether sufficient means of exit exist. The report has not yet been published, but from private sources it is learned that some buildings in which large congregations of visitors daily assemble have been found to be dangerous in this particular.

THE annual dinner of the Leeds Association of Engineers was held at the Queen's Hotel, Leeds, on Saturday, the 5th inst., Mr. A. Tannett Walker presiding. Professor Boddington, Yorkshire College, in proposing "The Clergy,"

Fountain Street, Bury, and Shiffnall Street, Bolton:
February 13, 1891.

Gentlemen,—We have pleasure in announcing that we have opened extensive Show Rooms at 117 QUEEN VICTORIA STREET, LONDON (opposite Civil Service Stores).

We have been very successful in Lighting and Ventilating Public Buildings in all parts of the Country.

We have a large stock of Sunlights, Turrets, Exhaust Roof Outlets, Tobin's Tubes, Air Grids, &c., &c., at our Show Rooms.

We feel confident that our **DESIGNS**, as well as our system of Lighting and Ventilating will commend themselves to all who are interested in having BRILLIANTLY LIGHTED and WELL-VENTILATED ROOMS.

A visit to our Show Rooms will be esteemed a favour. If inconvenient to call, send for one of our Illustrated Catalogues, inspect our Designs, and read our Testimonials.

Trusting to receive your favours, which shall have our prompt attention,

We remain, Gentlemen, yours obediently, **J. H. PICKUP & CO.**

said the toast ought to be especially welcome in a society of engineers. They might not be aware of the fact, but between the engineering profession and the profession of ministers of religion a curious connection existed. The engineering profession was really an offshoot of the clerical profession. He admitted that it was a long time since the two were combined, but still, combined they undoubtedly were. In ancient times learning was the prerogative of the clergy, and the engineering work required to be done among the primitive people had to be done by the clergy. And if they went back more than two thousand years to the history of ancient Rome, they would find that the clergy were dignified by the significant name of bridge-builders. The professions had been to a certain extent differentiated since that time, and he dared say Dr. Talbot (vicar of Leeds) was very glad he had nothing to do with calculating stresses and strains or bridging the Aire, and without any disrespect to the clerical profession, he would venture to say that the travelling public were more confident in the matter of bridges because they were designed by such men as Sir Benjamin Baker than they would be if designed by Dr. Talbot, or even by the Archbishop of Canterbury or Mr. Spurgeon.

IT has been decided to acquire the Masonic Hall at Harborne for the purpose of a free library.

AT a meeting of the Markets Committee of the Leeds Corporation the proposal to roof in a portion of the uncovered ground lying between the entrance near the George Hotel and the Fish Market came up for consideration. After discussion, the committee resolved to adopt a plan, founded on the same principle as the roof of the new Midland Station at Bradford, which involves an expenditure of about 4,000*l.*

THE Burslem Town Council intend to make application to the Local Government Board for sanction to borrow 4,000*l.* for the purchase of property in St. John's Square, Hanover Square, and Furlong Passage, required for street improvements.

THE Parks Committee, Glasgow, have recommended the Corporation to acquire about 35 acres of the lands of Mosesfield, at 400*l.* per acre, and about 13 acres of the adjoining property of Cocksmuir, at 300*l.* per acre, for the purposes of a recreation-ground for the Springburn district of the city.

AT the meeting of the Birmingham Association of Students of the Institution of Civil Engineers, held at the Midland Institute, the president, Mr. J. Edward Willcox, in the chair, a paper was read by Mr. H. Hyatt on "The Testing and Manufacture of Portland Cement."

A NEW vestry is about to be erected for St. Patrick's Roman Catholic Cathedral in Armagh, for which the measurements have been taken by Mr. Hague, architect, Dublin, and thirteen statues for the niches in front of the cathedral are coming from Italy.

THE construction of a promenade pier at Dover has just commenced. The pier will extend seawards for 1,000 feet.

THE Mersey and Irwell Joint Committee have approved the draft of a Bill for conferring additional powers on the committee for the more effectual prevention of river pollution.

INTELLIGENCE has been received in Glasgow of the death in Chicago of Mr. D. G. Hoey, a well-known citizen of Glasgow. A strong inclination towards mechanics led him to turn his attention to the ventilation of public and private buildings, and he gave up the business of an accountant and devoted himself to the perfection of the system of ventilation which he had introduced. To enable him more effectually to do this he removed to London. His visit to America was in connection with the improvement of the ventilation of the underground section of the Baltimore and Ohio Railway.

THE Glasgow Association of the students of the Institution of Civil Engineers have just held their first general meeting in the Institution Rooms. Mr. W. R. Copland, the president, in an opening address, treated of the training and education of young engineers, and gave some advice for their guidance and success in the profession.

AT the first meeting of the newly-constituted Trinity Hospital Committee of the Edinburgh Town Council the convener, Councillor Colston, inaugurated his term of chairmanship by disclosing a scheme, which he has resolved upon, for extending the benefits of the charity by raising 10,000*l.* for the establishment of cottage homes.

THE great height of many buildings already erected in Chicago, and the fabulous number of storeys contemplated by the plans of a new Oddfellows' Temple, have brought to a point the agitation against such structures. On one day recently five permits were taken out for the erection of buildings 16 storeys high, to cost in the aggregate 600,000*l.* That evening the City Council met and directed the Commissioner of Buildings to give no permits for structures exceeding 12 storeys, until the question of limiting height is discussed and finally settled.

AT the meeting of the Rochdale Town Council, the chairman of the Health Committee said that during the last quarter

"SPHINX" PORTLAND CEMENT

112 lbs. per bushel. Slow setting; test 1,000 lbs. to 1¼ inch; seven days. Fineness, 2,500 meshes to square inch, with less than 10 per cent. residue. Over 10,000 tons supplied to Cardiff and Hereford Water Works.

Specially adapted for Concrete Floors and Street Paving.

the smoke-production by manufacturers in the town had been reduced 24 per cent.

AT the meeting of the exhibition committee of the Southport Centenary Celebrations Committee it was stated that the spring exhibition would be closed on May 14, in order that it might not clash with the Centenary Exhibition of Fine Arts; that Mr. Agnew had consented to lend a number of his own private collections, and also to inaugurate a unique exhibition showing the development of the art of pottery.

BUILDING AND BUILDERS.

SCARCELY a week, the *Canadian Architect* (Toronto and Montreal) says, passes during the building season that is not marked by serious injury or loss of life by reason of defective scaffolds. It is unfortunately true that the responsibility for most of these accidents rests with the workmen themselves rather than with their employers, and for this very reason it is impossible to guard against their recurrence. The workmen themselves construct the scaffolds, and should see that in point of material and construction they possess the necessary margin of safety. Reckless overloading of scaffolds has probably led to most of the accidents.

AN addition to the Nurses' Home at the Western Infirmary, Glasgow, which has recently been extended so as to accommodate the whole nursing staff, has been opened. The extension consists of three new flats, which contain forty-seven additional rooms, and the cost, including furnishing, amounts to about 10,000*l.*

AT the annual meeting of the Ayr Guildry Court Captain Girvan, master of works, was unanimously elected Dean of Guild.

IT is proposed to convert the Mechanics' Institute, Heckmondwike, into a technical school. Local architects have been invited to send in plans for altering the building.

THE *Leeds Mercury* says:—A staff of men are at present engaged improving the sanitary arrangements of the Town Hall, under the direction of Dr. Cameron, the medical officer of health. These measures are, however, only temporary, and the Corporate Property Committee contemplate a much more extensive scheme in substitution for that which, though it answered its purpose when the building was erected, is now out of date.

THE Edinburgh Dean of Guild Court have granted a warrant for alterations and additions at the Balmoral Hotel. The alterations consist of the demolition of the present back buildings, and the erection in their place of a restaurant and drawing-room on the ground floor, a dining-hall on the first floor capable of accommodating 250 people, and three flats of bedrooms above.

A RECOMMENDATION of the Wedgwood Institute Committee, that plans of additional buildings, estimated to cost 1,800*l.*, be approved of, so far as relates to the general arrangements, has been adopted by the Burslem Town Council.

A NEW Board School is to be built near Thornton for the Dysart Landward School Board, N.B.

TRADE NOTES.

THE Alliance Assurance Company's offices, Shrewsbury, are being warmed and ventilated by means of Shorland's patent Manchester grates, supplied by Mr. E. H. Shorland, of Manchester.

A NEW church has been erected at Bromwich, and the ventilation has been carried out by the Climax Ventilating Company, of 15 Great George Street, Westminster, one of their direct-acting turret ventilators, specially designed to harmonise with the general features of the church, being fixed at the intersection of chancel and nave. The work has given the utmost satisfaction, all down-draught being effectually prevented.

THE architects for the Leeds and County Liberal Club have entrusted the order for the ventilation to Messrs. Baird, Thompson & Co., ventilating engineers, London and Glasgow. The ventilation of the large Catholic church of St. Mary's, Burnley, carried out by this firm, has given the greatest satisfaction, and the Rev. J. Morrisey has written Messrs. Baird, Thompson & Co., expressing his gratification at the efficient results. The whole of the ventilators are entirely concealed, and a complete and efficient system of ventilation has been carried out without draughts.

AT the monthly meeting of the Halifax Town Council it was reported that the Markets Committee had accepted the tender of Messrs. George Townsend & Son, for 2,940*l.*, for joiners and carpenters' work in connection with the new arcade and shops, in consequence of the withdrawal of Messrs. Fielding

& Bottomley. Messrs. Charnock & Sons having refused to sign the contract for the excavators, masons and bricklayers' work for the arcade and shops, that of Messrs. Birkby & Sons, Wyke, for 6,520*l.*, had been accepted by the committee. The Board of Works Committee had accepted the tender of Messrs. G. & H. Tyson, for 2,919*l.*, for an intercepting sewer in Queen's Road.

AT a recent meeting of the directors of the Highland Railway Company contracts were accepted for the third and fourth sections of the new Aviemore line, extending from Strathnairn to the Inverness side of the river Findhorn. For the first section—a distance of over eleven miles—the offer of 87,129*l.*, by Messrs. John Ross & Son, was accepted. The fifth section, consisting of the masonry of the great viaduct over the river Findhorn, was entrusted to Messrs. Wm. Alexander & Co., Inverness, whose offer amounted to 24,264*l.*

AT the meeting of the sub-committee of the Cleaning and Lighting Committee, Edinburgh, *re* the refuse destructor, Mr. Howden, engineer, Glasgow, gave an explanation of his plans for the erection of a destructor at Powderhall, with the hot-blast application. The work for the erection of the destructor alone is estimated at 3,300*l.*

THE Christiania municipal authorities have concluded a contract with a Nuremberg firm for the supply of the necessary machines, accumulators and cable for lighting the city by electricity. It is stated that the cost of the appliances amounts to 750,000 marks.

THE Nottingham Town Council have empowered a special committee to spend 25,000*l.* to 30,000*l.* in lighting a central section of the borough by electricity.

THE Wednesbury Town Council have passed a resolution, "That the following clause be inserted in all contracts entered by the Corporation :—The contractor must not pay to the work-people he employs on the work contracted for less than the minimum standard rate of wages current in the district in which such men are employed. This condition to apply also to any work he may sub-let."

MR. JOHN GRUNDY, of 30 Duncan Terrace, City Road, London, N., and Tyldesley, is supplying his warm-air ventilating grates to Mount Zion Church, Clerkenwell, E.C.

MESSRS. GILLETT & JOHNSTON, clockmakers and bell-founders, of Croydon, have just succeeded in obtaining the order for a large turret clock and bells for Pietermaritzburg Town Hall, Natal. The clock is to be constructed to strike the hours on a large bell, to chime the Westminster quarters on four others, and to show the time on four 8-feet 6-inch dials. It is to have all latest improvements, and will, in fact, be almost a facsimile of the clock, &c., which the same firm are now making for Eastbourne Town Hall. Messrs. Gillett & Johnston have at present in hand two large clocks for Kurrachee clock tower (India) ; and, amongst others, large clocks for Epsom College, Parkwood Convalescent Home, Caledonian Road Baths, London, &c. They have just completed rehanging the bells at Newnton Longville parish church, where they are now engaged in fixing-up a new turret-clock which they have supplied.

AT a special meeting the York City Council adopted a recommendation of the committee having charge of the new sewerage scheme, in favour of the acceptance of the tender of Mr. Abraham Kellett, of Ealing, for the completion of sewerage contract No. 2 for 75,830*l.* 16*s.* 4*d.* (the amount of his original tender), subject to the deduction of an amount to be agreed upon between Mr. Kellett and Mr. Mansergh, C.E., in respect of the work executed by Mr. Bottoms.

AT a meeting of the Works Committee of the Aberdeen Harbour Board, the tender of Messrs. John Rust & Son, amounting to 842*l.*, was accepted for the extension of the wharf in Albert Basin.

NEW CATALOGUES.

AN illustrated catalogue has just been issued by Messrs. Woodhouse & Rawson United, Limited, 88 Queen Victoria Street, London, E.C., for the coming year, of electrical machinery and apparatus connected therewith, including engines, dynamos, accumulators, lamps, switches, fittings, instruments, &c. The section (Section 8, List "B") contains prices of steam and electric cranes, lathes, drilling machines, tube welders, &c. The catalogue opens with details of this firm's steam and electric cranes and winches for all requirements. Subsequently machinery for mining, pumping, drilling, coal-cutting purposes, circular saws, lathes, planing and high-speed drilling machines, &c.

WE have received an illustrated catalogue just prepared by Messrs. W. Summerscales & Sons, of the Phœnix Foundry, Keighley, Yorks, of their high-class modern laundry machinery, and all appliances connected with the same. The recognition received by Messrs. Summerscales & Son of the excellent of

their machinery has encouraged them to spare neither effort or expense in placing many new machines before the public. The catalogue contains over seventy pages, so it is easy to conclude what a large variety of appliances is comprised under the simple title of laundry machinery.

THE GAS SUPPLY OF LONDON.

THE Board of Trade has undertaken to appoint a committee to consider what the standard of light for testing the gas supply of London should be, the present candle standard having been found to be very untrustworthy. The appointment of the committee, which will be composed of scientific men, has been delayed because the Board of Trade and the London County Council have no fund available for paying the expense of a committee, while the London gas companies refused to undertake the cost. The South Metropolitan Gas Company, of which Mr. G. Livesey is chairman, have now undertaken to pay the whole of the expenses, and the committee will very shortly be formed. It will consist of two members nominated by the County Council, one by the City Corporation, three by the London gas companies, together with the three gas referees and two independent scientific men. Dr. E. Frankland, F.R.S., and Mr. Dibdin, the Council's chemist, will represent the London County Council. Pending the report of this committee, the Council has deferred action in the direction of obtaining legislation for a more exact standard of light.

THE TAXATION OF GROUND VALUES.

A CONFERENCE on this subject has been held under the presidency of Lord Herschell in Toynbee Hall. Mr. Fletcher Moulton, Q.C., opened it by moving a resolution to the effect that a separate rate ought to be levied upon the value of land in towns, to be paid by the owners of the respective ground values. The importance of the question, he said, could hardly be exaggerated. The arguments in favour of the view he was supporting would by that time be familiar to many, but must be repeated until their force was widely acknowledged. He then enlarged upon the reasons why it was expedient and necessary that there should be direct taxation of the land in towns, and that this should form a considerable portion of municipal revenue. He dwelt upon the enormous increase in the value of town land, remarking that such increases were most marked in the world which spoke the English language. In the course of the discussion that followed, the chief difficulties besetting the matter were pointed out, and Mr. Moulton, in reply, dealt with each of these at some length. It had been contended that the proposed change would not make any difference to the occupier, as what the landlord had to pay in additional rates would be put on to the rent. Mr. Moulton admitted that such might be the case at first, but he was convinced that under the new order of things which they sought to set up the argument would turn out to be based on a complete fallacy. Lord Herschell, in proposing a vote of thanks to Mr. Moulton, briefly reviewed the opinions expressed that evening without offering any of his own, and the meeting soon afterwards came to an end.

ARBITRATION IN CONTRACT DISPUTES.

THE Court of Appeal have determined a question which affects the arbitration clause in contract deeds. The plaintiff, Mr. Eyre, in October 1888 obtained a contract for the construction of a main sewer in Leicester. There was among the conditions a provision for the reference of disputes to arbitration, and the award was to be made by the "arbitrator or umpire to be appointed." A dispute having arisen after the completion of the work, the plaintiff called upon the defendants to appoint an arbitrator. They denied that the case was one for arbitration, and refused. He then sent them a notice to concur with him in the appointment of a sole arbitrator to act in the matter for the purposes of the arbitration, and that in default he should apply to the Court to make the appointment under the Arbitration Act, 1889. The defendants refused to comply, and the plaintiff accordingly applied at Chambers for an order appointing an arbitrator. His application was refused by the Master and the judge, but was granted by the Divisional Court. The defendants appealed.

The Master of the Rolls said that he agreed with the Divisional Court that there was here an agreement to submit any disputes to the arbitration of a single arbitrator. Therefore, when a dispute arose either party might under section 5 of the Arbitration Act, 1889, serve the other party with notice to appoint an arbitrator. A dispute had arisen, for it was admitted that part of the plaintiff's claim was within the arbitration clause in the contract. It was

NOTICE.

ON VIEW, AT 48 QUEEN VICTORIA STREET, E.C.,

ONCKEN PATENT STAVELESS BARRELS.

This remarkable invention, which enables Barrels to be made in One Piece by a New Process, has excited the greatest interest among Engineers, Coopers and others in England and the Continent; 20 per Cent. Economy in Wood and 50 per Cent. in labour.

An influential Company is being formed for working the invention, Prospectuses of which will be forwarded when ready, upon receipt of Name and Address, by the undersigned.

Barrels, Tubs, and other Articles, can be seen daily between Ten and Five o'clock.

ARTHUR L. FOLEY,
SECRETARY (pro tem).

48 Queen Victoria Street: November 1891.

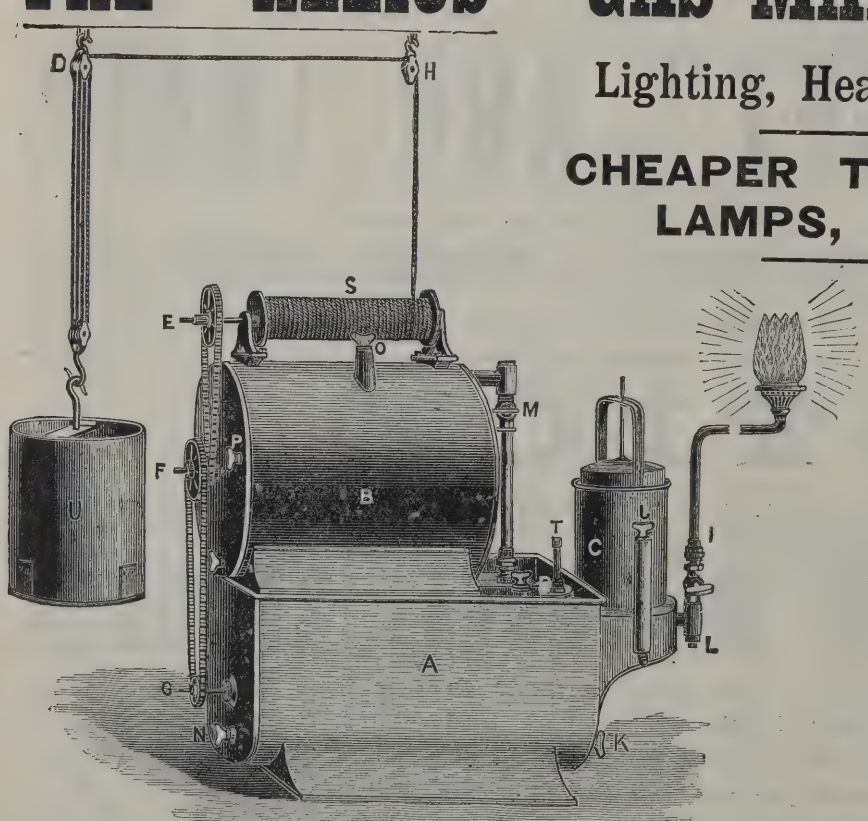
said that the notice which the plaintiff had given was wrong because it did not call on the defendants to appoint an arbitrator, nor did it call on them to concur in the appointment of a named arbitrator. That objection was too fine and too technical, and could not be countenanced. The question therefore arose as to the power and duty of the Court in such a case. There was a dispute within the submission ; the proper notice had been given and had not been complied with. The Act said that in such a case the Court "may" appoint an arbitrator. It was contended that that gave the Court a discretion, but in his opinion "may" must be read as meaning "must." When the parties had agreed to submit disputes to arbitration, and such disputes had arisen, and one of the parties had refused to concur in appointing an arbitrator, it would be monstrous if the Court could, by refusing to appoint, force the parties to go to law. He disagreed, therefore, with the Divisional Court, who had sent the matter back to the Master to decide whether there should be an arbitrator or not. All that the Master could do would be to say who the arbitrator should be. The order would, therefore, be varied in that respect.

Lord Justice Lopes concurred.

Lord Justice Kay thought that in this case the Court, even if it had a discretion to refuse to appoint an arbitrator, ought not to exercise that discretion. He, therefore, concurred in the decision, but he wished to guard himself from saying that in every case under the Act "may" must be read as equivalent to "must."

THE SANITARY ARRANGEMENTS OF MANCHESTER.

AT the last meeting of the Manchester Medico-Ethical Association Dr. Tatham, medical officer of health for the city, read a paper on "The Laws and By-laws Regulating the Sanitary Arrangements of the City of Manchester." He said that the bulk of the old part of Manchester was built at a time when, he feared, there were no by-laws. Otherwise he could not believe that such a network of narrow streets, blind alleys, tunnelled passages and filthy slums could have been perpetrated as those which were to be found almost anywhere in the older parts of the city. The building by-laws which were in force from the year 1868 up to about twelve months since certainly needed amendment. That this was so had been fully recognised by the Corporation, and it was said that the new by-laws which had just seen the light had been undergoing the process of incubation for a period of well-nigh ten years. Of these new by-laws it deserved to be said that they were the best set of building by-laws possessed by any Corporation in England. His only fear was lest a certain class of Manchester builders might be able to bring such pressure to bear on the Corporation as to induce them to relax in some respect the stringency of these by-laws, and thus to bring about a return to the old state of things. They were told that the present by-laws in respect to their maximum requirements of air spaces and strength of materials were unworkable, and would prevent the erection of labourers' dwellings in the business parts of the city. His answer to this charge was that the building by-laws were adopted in their present form after the most patient and anxious consideration by the Council in consultation with the chief architects, builders and others who were thought to be able to give useful advice with respect to them. Also that the new by-laws had received the approval first of the Local Government Board and subsequently of Parliament itself ; and that if it turned out that they made jerry property building impracticable so much the better for the prospective dwellers in the city of Manchester. He did not hesitate to declare his conviction that the policy which should guide sanitary authorities all over the country in providing dwellings for the labouring classes was not that of the crowding together of cottage dwellings in the close and confined areas of our great towns merely because they would be convenient of access to workpeople. The wise and only safe policy was to destroy the rookeries and dungeons miscalled dwellings in the slums of our congested districts, and to force the people, or most of them, to seek a dwelling-place outside the congested area where building land was cheap and where houses were or should be healthy, and to follow up those workpeople with cheap tram fares and cheap railway tickets. It was obvious that sanitary authorities could not go, and they would not be wise in attempting to go, very far in advance of public opinion. He greatly desired that public opinion should rise to something like a worthy conception of the duties which society owed to its less fortunate members, and he had accordingly always held that one of the most useful functions which a medical officer of health could discharge was that of educating the people in matters of their personal health. He expressed the hope that in endeavouring to carry out this important part of his duty he might have the actual co-operation of his colleagues in the medical profession.



Dr. Braddon moved a vote of thanks to Dr. Tatham for his paper.

THE "HELIOS" GAS-MAKING MACHINE

FOR

Lighting, Heating, and Motive Power.

CHEAPER THAN COAL GAS, OIL LAMPS, OR ELECTRICITY.

This Machine is the latest development of the Oil Gas systems. In most other such machines Gasoline is the gas-producing material, and as this can only be procured in large quantities, and is dangerous to store, there is naturally a great objection to its employment. The "Helios" Gas Machine is charged with Benzoline, which can be procured anywhere in large or small quantities. The Machine is simple, and the light produced far superior to coal gas. Machines made to supply from 6 to 2,000 lights.

Prices from £10 10s.

UNEQUALLED FOR

COUNTRY HOUSES, FACTORIES, HOTELS, &c.

FOR FURTHER PARTICULARS APPLY TO

THE INCANDESCENT GAS LIGHT CO., LIM.

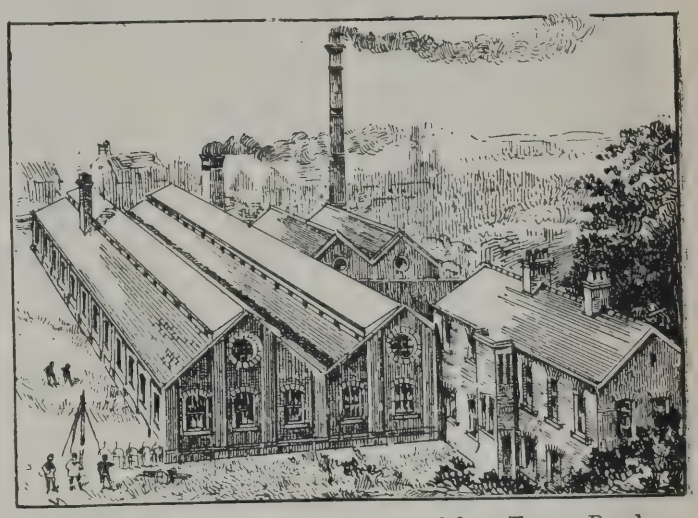
14 PALMER STREET, WESTMINSTER, LONDON.

Dr. Emrys-Jones, in seconding the motion, remarked that the position of medical officer of health should be as independent as possible.

Alderman Bailey said the jerry builders usually did what they could to become the masters of the man who was their critic and judge. It was very desirable, as Dr. Emrys-Jones had remarked, that the medical officer should be in an independent position.

Mr. Councillor M'Dougall said there was no fear that the Corporation would relax the new by-laws.

Dr. R. C. Smith suggested that a number of the empty old mills in Ancoats should be pulled down and their sites utilised as open spaces. He suggested that every house in Manchester should be visited at least once a year and certified as being in a sanitary condition.

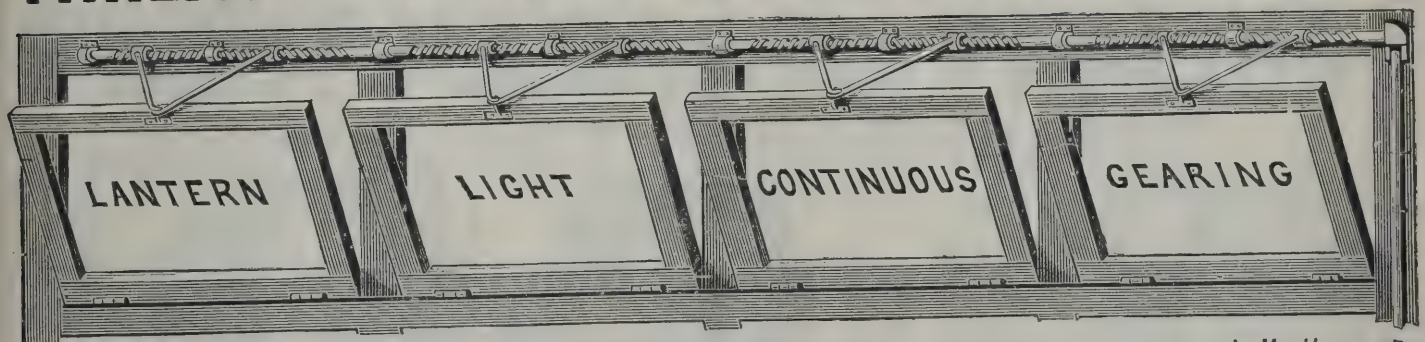


SANITARY INSPECTORS' ASSOCIATION.

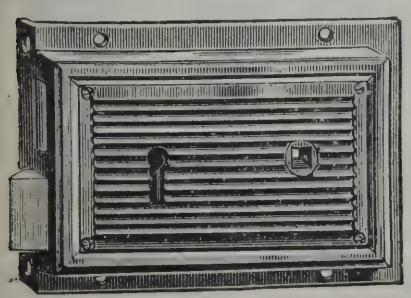
AT the monthly meeting of this Association, held at Carpenters' Hall, an address was delivered upon "The Public Health (London) Act, 1891," by Mr. E. Lewis Thomas, M.A. (honorary counsel to the Association). Mr. Thomas dwelt at some length upon the codification, modification and consolidation of the several Acts which had been included in the Public Health Act, and said it provided for London a sanitary code similar to that which in 1875 was given to the rest of England and Wales by the provisions of the Public Health Act, 1875. Since the year 1875 several attempts had been made to codify the sanitary enactments in force in London. In 1877 a Bill with that object was introduced into the House of Commons by Lord Basing, then Mr. Sclater-Booth, the president of the Local Government Board, a similar measure being brought into the House of Lords in 1885 by Lord Salisbury. Both these attempts to deal with the matter were unsuccessful, and it was not until 1891 that there was accomplished for sanitary administration in London, with its five million inhabitants, that which had been done sixteen years before for the remainder of the country. The Act applied to the whole of the administrative county of London as defined by the Local Government Act, 1888, the City of London being in the same position, with one or two exceptions, as the other sanitary districts within the metropolis. He thought the Act was one which would prove of great advantage to Londoners.

ART METALWORK.

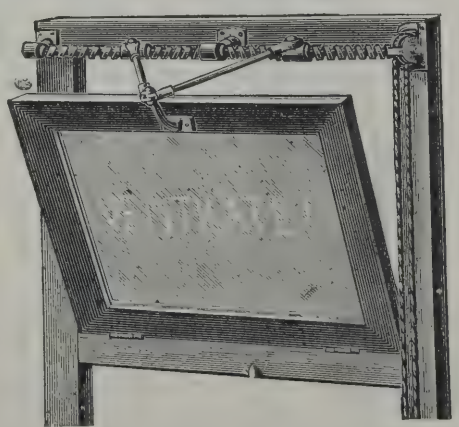
THE taste for artistic metalwork has increased amazingly during the last few years, as evidenced by the numerous wrought-iron gates and other ironwork which we see in many parts of the town and country, which have taken the place of much of the unsightly and brittle cast-iron which was so greatly used. The design and finish of the gas and electric fittings, staircases, &c., in all our new public buildings have much improved, and are really works of art in many cases.



We had the pleasure last week of visiting the new factory which Messrs. Jones & Willis, the well-known and old-established firm of art metalworkers and church furnishers, have



built at Hornsey, they having now removed from Euston Road, where they had been many years, as they found it too small for their increasing business. The new works are within five minutes' walk of Hornsey Station, G.N.R., and close to the old parish church. The works, which are all on one floor, stand in two acres of ground. Mr. Herbert Willis, who superintends the metal department of the firm (by whom we were courteously received), first showed us the draughtsman's office, a very light and spacious room; passing through the other offices, we



JAMES HILL'S PATENT

JAMES HILL, 100A QUEEN VIC TORIA STREET, LONDON, E.C.

arrive in what is called the rough warehouse, in which are kept bar iron, brass and copper sheet, metal tubes, brass castings in the rough ready for working up, thousands of patterns of all sorts and sizes for making into brass goods, such as scrolls and leaves, eagles and angels for lecterns; another warehouse being set apart for goods made up in the rough, ready for finishing. Next we visited the brass shop, in which gasaliers and electroliers were being made, several eagle lecterns in all stages of finish, some of which were very handsome and others of a less ornate character. Adjoining s the polishers' shop, where all the brasswork is polished by machinery, a very interesting process. After that the brasswork is taken into the lacquering-room, where it is heated on stoves, and a clear lacquer is applied to exclude the air from the brass and so that it may keep its beautiful colour. We were then taken to the silver shop, where the communion sets, alms dishes, vases, &c., are made; among others we noticed a very handsome silver chalice and paten in process of making; it was relieved by some very rich *repoussé* work. We were particularly interested with the next shop, the engravers'; on the walls we noticed rubbings of some handsome brasses recently executed, one being to the memory of Colonel King-Harman, and another elaborate one to Sir Evan Morris. Several brasses were in course of execution, communion sets and numerous other articles in silver and brass were being engraved. The foundry next took our attention, where parts of brass lecterns, gas-fittings, &c., were being moulded; we also saw two or three eagles in the moulders' hands.

The smith's shop is a very fine roomy place, and we noticed that a great number of smiths and fitters were at work on gates, railings, grilles and chancel-screens, the following being in hand or just completed:—Large iron screens for All Saints, Acton; St. Clement's, Fulham; St. Luke's, Leicester; St. Matthew's, Luton. We next saw parts of a staircase being executed under the supervision of Mr. Wm. G. Bartleet, and another for Messrs. Hine & Odger, of Plymouth; also gates and door furniture for Mr. Joseph S. Hansom, and a sign for Mr. George Thorp, and several gas and electric fittings.

As Hornsey is within easy distance of either the City or the West End, it will be very convenient for architects who entrust their work to Messrs. Jones & Willis to see their work in course of execution. We feel it would amply repay a visit from anyone who is interested in art metalwork.

Their works at Porchester Street, Birmingham, are extensive and well adapted to the manufacture of the wood and stonework which is executed there. The ground-floor contains the machinery specially designed to meet the requirements of their work, also the masons and marbleworkers' shops and packing-shops, above which are their joiners and woodcarvers' shops, in which we noticed they had in hand a quantity of work for many well-known architects, amongst which may be mentioned oak fittings for the interior of St. Mary's Priory Chapel at Princethorp, under the superintendence of Mr. Joseph S. Hansom. Also canopied priest-stalls for St. Cuthbert's Church, Kensington, to the designs and drawings of Messrs. Roumieu Gough & Roberts, and the whole of the interior fittings for two

cemetery chapels at Morden, Surrey, and several other works; in fact, from the staff of men employed by them, they must have the patronage of many of the architects in the country. Their appliances for timber-drying are such as to insure the timber used being thoroughly well-seasoned, as, after being dried in the open until it is as dry as it can be made outside, it is subjected to a heat of from 80 deg. to 100 deg. for some time before being used, and the large stock of oak, walnut and pitch-pine enables them to put in hand any quantity of work at a moment's notice, thus giving them an advantage over houses who keep small stocks.

COLDBATH FIELDS PRISON SITE.

THE Postmaster-General, in a letter to Mr. R. Paget, vestry clerk of Clerkenwell, states that as it is now decided to retain the whole of Coldbath Fields prison site for parcel-post purposes, he would be willing to remove the old prison wall and substitute iron railings from the corner of Calthorpe Street to Oldham Gardens, Farringdon Road, setting them back to increase the width of the street to 60 feet, on condition that the vestry will reset the pavement and remake the road. Originally it was intended that the entire site of the disused prison should be utilised for industrial dwellings or maintained as an open space, but the sum of 10,000*l.* has been paid to the London County Council in lieu of the reservation of even a part of the land as a recreation-ground. Having regard to the fact that Clerkenwell has now in the enclosures of Wilmington and Northampton Squares two public recreation-grounds, besides a large playground for children at Spa Fields, it is thought that more open spaces in the parish are not needed, and that the 10,000*l.* would be more usefully employed as a contribution towards the erection of a town hall on the line of the new thoroughfare from Holborn to the Angel than in providing an additional pleasure or leisure ground.

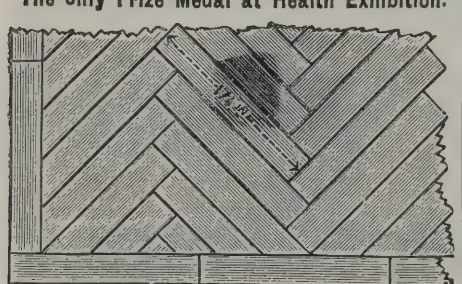
ECONOMY IN VENTILATION.

THE ventilation of buildings has been for many years considered quite as essential a part in the production of a finished building as providing walls and covering them with a roof. The ventilation of a building or its separate rooms is easily secured most effectually if in somewhat of a primitive manner by throwing open windows or doors, or both together. Except in cases of airing a room at a time when it would not be used, the remedy was perhaps worse than the evil. Means of ventilation were then devised to obviate having recourse to the draughts from windows or doors to secure the replacement of vitiated by fresh air. By these means a different state of things was inaugurated. The draughts were as abundant as ever, but it could only be reckoned that they would not come through window or door ; but they still came. At last it seemed to be considered quite a problem how a building might be effectually ventilated without producing draughts. But that buildings can be ventilated, and the inside air kept pure and sweet as the outer air, without motion in the air being perceptible, is not to be denied. We have visited buildings which have been in full use, and the wonder has been how those within them could stand the combination of heated and vitiated air. Other buildings, again, have been as agreeable as the outer air which we had just left. In this latter case the success has been achieved by use of fans. No doubt this system has not been adopted so much as might be as it was considered costly. The problem of ventilating has therefore in many cases been assumed rather than believed to be insoluble. It may be as well to say that it is a mistake to consider this system is costly. The plan cannot be said to be on trial, as for some years past it has been found to be a cheap and effectual method, by use of the Crossley "Otto" gas engines. We have before us at the moment particulars of the ventilation of the Middle Public School in Aberdeen. There a Blackman fan 5 feet in diameter, propelled by a three-horse power nominal Crossley's "Otto" vertical gas engine, introduces a current of air of required volume to be dispersed through the building. The windows of the building cannot now be opened in summer or winter, and the fireplaces have also been abolished.

In winter the incoming air undergoes, on its way to the fan, the double process of cleansing and warming, the first process alone, of course, being necessary in summer. The cleansing is effected by means of a screen of Manilla hemp, the fibrous cords of which are kept moist by an occasional flush of water from an overhead trough. All particles of smut and dust are by means of this screen arrested on their way into the building, and washed off in due course. A coil of hot-water pipes stands outside the washing screen to protect it from frost, but the real warming of the air occurs when the screen is passed and the entering current comes in contact with the heat radiating from a still larger coil of high-pressure hot-water pipes occupying the chamber in front of the fan. These pipes are maintained at a good heat by a patent slow-combustion furnace occupying the adjoining furnace-room. The fuel used is gas-coke, costing much less than steam-coal. By the admixture of a slight current of air with the furnace-gases of the burning coke an intense heat is generated on a remarkably small consumption of fuel. In ordinary winter weather pure air, at a temperature of 60 degrees, is propelled by the fan into the main duct, from whence it finds its way by branch ducts up to the classrooms, at a temperature about 5 degrees less than this. At 55 degrees the air in the classrooms is temperately warm, and at the end of a two-hours' sitting the thermometer is usually found to have risen still further if the rooms are occupied by their normal

MAW & CO., LIMITED, will forward on application Pattern Books or Special Designs, with Estimates for all kinds of Floor and Wall Tiling. Patterns can also be seen and particulars obtained at the Show-rooms of their appointed London Agents, Messrs. W. B. SIMPSON & SONS, 100 St. Martin's Lane, W.C.

complement of pupils. In extreme frost a smaller furnace, heating a secondary coil of hot-water pipes within the main air duct, gives the additional warmth needful for a very low external temperature. On the other hand, provision is made for immediately reducing heat in the classrooms without withdrawing fuel from the furnace—a most desirable thing in certain months of the year, when the alternations of temperature after sunrise are often rapid and unexpected. The whole has been applied from the plans of Mr. William Key, of Glasgow, who has so successfully engineered the ventilating and heating arrangements of the new Victoria Infirmary there, in which the machinery comprises an air-washing screen, steam coils for heating, and a duplicate set of Blackman fans, each driven by a Crossley's "Otto" gas engine. Mr. Key has also designed the slow-combustion furnace in the Middle School, the air-washing screen, and the compact system of coiling the hot-water pipes in a heating-chamber abutting on the main building.



The outlet for the air after it has done its duty is most efficiently and skilfully provided for, though space will not now allow of describing the mode. As to the cost, the daily working expense of the system is made up of the supply of gas and of the necessary repair and oiling of the engine. An engine of the Crossley "Otto" type used in the Middle School, which the School Board has found by experience to be the most economical and reliable, and to require the least attention, will do the work required of it on a consumption of from 40 to 50 feet of gas per hour, and allowing for six hours' running per day, and for gas at 3*s.* 6*d.* per thousand cubic feet, the expense will be seen to be about 2*d.* per hour. Repairs and oil will not exceed 2*l.* or 3*l.* per annum. A school janitor will speedily familiarise himself with the working of the engine, which when started of a morning will work all day with little or no attention. Adding, therefore, to the current working expenses the interest on outlay, and the sum required as a sinking fund to repay original cost, it will be found that the expenditure on a school of 1,000 children does not exceed 25*l.* per annum, or about 6*d.* per head. The cost of heating under this system is, on the other hand, very much less. Sufficient time has not yet elapsed to permit of a winter's firing of the slow-combustion furnace before referred to, but enough has been seen to prove that in point of economy the furnace is a decided gain, and that in raising heat its action is rapid. If a building is designed at the first for this system the prime cost can be little. Even applying it to existing buildings cannot be of great moment, when we daily see houses and buildings practically one-quarter pulled to pieces to improve the appearance or possibly to gain a few feet more space in the rooms, &c. We are accustomed to this. By-and-by it will be as much a matter of custom to consider it the right thing to lay out money to secure the advantages of fresh air, which can be had by less trouble and less expense than is often bestowed on more dubious improvements.

Mr. William Key writes with reference to the Crossley's "Otto" gas engines :—"Two gas engines, each 4 horse-power nominal, were erected by you in the New Victoria Infirmary, Glasgow, and having designed and carried out the ventilating and heating of that building with pure washed and warmed air, propelled by fans driven by these engines, I can say that each engine was running for twenty-three and a half hours daily for over twelve months without the slightest hitch having occurred, only stopping one engine at a time for half an hour daily to cool and oil it thoroughly. It has been quite a pleasure to see them steadily and economically at work. The gas consumed by the engines was for the greater part of a year equal to 1·96*d.* for each million cubic feet of air propelled into the infirmary, and latterly was as low as 1·42*d.* per million cubic feet of air."

THE "SUNRAY" CONDENSING STOVE.

THE illustration shows the excellent heating-stove known as the "Sunray" condensing stove, the sole makers of which are Maughan's Patent Geyser Company, Limited, of 51 Queen Victoria Street, E.C., and 266 Sauchiehall Street, Glasgow. The stove is an apparatus for heating by gas in a highly economical way. In addition it may be said to be indispensable as a warming apparatus in numberless cases, where for many reasons other modes of heating are impracticable, and where hitherto the attempt to warm by artificial means has necessarily had to be given up. An objection to heating by employing gas-stoves has been that warmth has been secured by disagreeable accompaniments of smell and vapours from imperfect combustion, always unhealthy, and too often unbearable from the immediate production of a sickly atmosphere. As far as our experience goes, it is gratifying to be able to state that the "Sunray" is entirely free from these objections. The following are among the advantages that the company claim and rely on for success in the "Sunray." That it is the best and cheapest means of warming offices, rooms, shops, entrance halls, conservatories, public buildings, &c., being the

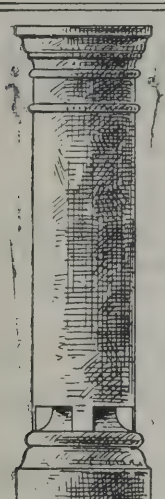
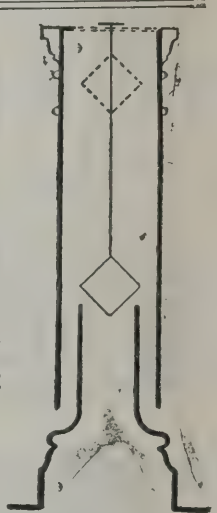
most efficient and economical apparatus for heating by gas yet introduced. It has all the advantages of the ordinary gas fire, cheerful in appearance, and throwing the greater part of the heat downwards by direct radiation, effecting a saving of from



50 to 75 per cent. in gas consumption; no flue or chimney is required, and the whole of the heat produced is utilised. The gas is burnt under conditions securing perfect combustion, and any noxious vapours not consumed are condensed by contact with cold surfaces in the interior of the stove into a liquid form. That although condensing stoves in various forms have been before the public for some years, the great objection to them has been the absence of downward heat. That this objection is entirely removed in the "Sunray" condensing stove, which combines the advantages of both the radiating and the condensing principles. That there are also several minor difficulties with the condensing stoves hitherto made, such as breakage of glasses, difficulty in lighting, &c., all of which the "Sunray" stove obviates, as no glasses or chimneys are used, and the flame, being open, is lit and regulated as easily as any ordinary gas jet. That the "Sunray" stoves are handsome in appearance and very durable, being constructed of best materials.

The action is as follows:—Ordinary Bray's burners are placed near the bottom of the centre chamber. Just above is a plate of metal which becomes intensely hot, and reflects the heat downwards to the floor, and also improves the combustion of the gas, which is practically perfect. The products then pass up the centre chamber and down the side columns, where they come into contact with cold surfaces on which they condense. The liquid resulting falls into a loose tray placed beneath the stove. Tubes are placed inside the centre chamber and side columns, at the bottom of which the outside air enters, and, after being heated, is passed out at the top of the stove.

QUEEN'S GATE HALL.



WE recently had the opportunity of inspecting a very successful installation of the electric light at the Queen's Gate Hall, Harrington Road, South Kensington. It consists of sixty-five lights, and the fittings are of charming design. The effect of the whole is most pleasing, an opinion confirmed by the manager of Queen's Gate Hall, Mr. Hallums, to whom and to the numerous visitors to the hall it has given every satisfaction. The lights are controlled from one switchboard, to which Mr. Hallums has access by a private key. The complete installation was executed within a week, a feat for which the contractors, Messrs. Barnes & Low, Sussex Place, South Kensington, deserve every praise. The firm have also carried out an installation for the eminent photographer, Mons. Jacolette, adjoining the Queen's Gate Hall, for photographic purposes. The fact of entrusting Messrs. Barnes & Low with such special work is in itself a strong testimony to their ability.

THE
"CLIMAX" VENTILATING CO.'S
DIRECT ACTING
CHIMNEY COWL,
For the Preventing a Blow-down.

This Cowl is specially designed for preventing a blow-down and assisting the up-draught. It is admittedly the most efficient in the market. Its construction is scientifically and mathematically correct, and no matter from what direction the wind strikes it, a powerful upward current is established. It is noiseless, has no movable parts to get out of order, is easily cleaned, the cone over inner shaft being made to push up. It has THE very decided advantage over every other Cowl, IT IS SIGHTLY.

REGISTRATION OF PLUMBERS.

LORD BASING, a past president of the Local Government Board and the most active promoter of the Public Health Act of 1875, is entitled to be regarded as an authority on sanitary matters. His lordship, in distributing at Southampton the other day a number of certificates of registration granted by the Plumbers' Company, London, said he felt very pleased that so large a number of those engaged in the trade in that part of the country had obtained the certificates. He had been interested in the subject for some years past, and had attended more than one meeting of the Plumbers' Company. The nation was at that moment in deep anxiety as to the health of a member of the royal family, whose illness, for aught they knew, might have been brought about by some defect in house-plumbing arrangements, which it was the object of the registration system to prevent and get rid of. The plumbing industry was essential to the health and comfort of dwellers in houses, and he thought it was high time for the nation to be aroused to the fact. He hoped the time had now arrived when certificates of competency on the part of the plumbers would be as much a matter of course as certificates of competency had for some time been on the part of pharmaceutical chemists. Lord Basing subsequently presented several prizes and certificates of merit given by the Plumbers' Company to successful students in the plumbing classes at the Hartley Institution, Southampton.

THE NEW RAILWAY TO LONDON.

SOME important changes have been made in the scheme for extending the Manchester, Sheffield and Lincolnshire Railway Company's system to London. The London terminus, instead of being placed on the somewhat awkward site offered by Boscobel Gardens, is to be brought forward to the Marylebone Road, and will thus front the same great thoroughfare as Euston, St. Pancras and King's Cross. Two new branch lines are proposed from the main line into the passenger station. One of these is to run out on the west, near North Bank, and, crossing Grove Road, is to terminate near Carlisle Street, in which neighbourhood a large area of property has been scheduled for a coal depôt. The other branch, commencing also on the western side, near the Alpha Road, is intended, running by an easy downhill gradient, to form a junction with the Metropolitan Railway under the Marylebone Road. In carrying out these works the company will of necessity be compelled to close up certain streets and roads, in exchange for which they propose to construct two new streets, giving access over the area affected. One of these, according to the plans, runs from Lisson Grove to Park Road; the other runs into the Marylebone Road near Harewood Street, and parallel with the new station. The arrangements as to the taking of property in St. John's Wood for the purposes of a goods station remain as they were last Session. Certain alterations have also been made in the country route, which will, it is believed, leave the scheme practically unopposed so far as the extra-metropolitan part of it is concerned, unless it should be found impossible to come to terms over the agreement with the Great Northern Company. Negotiations on this subject are now going on.

A special general meeting of the M.C.C. has been held, for the purpose of discussing the effects likely to follow from the terminus of the railway being built adjoining the ground. The president of the M.C.C. committee, Mr. V. E. Walker, occupied the chair.

Mr. H. Perkins, the secretary, supplied particulars of the business done. The committee of the M.C.C. have strenuously objected to the construction of a railway terminus abutting on the grounds, but before the Parliamentary Committee some months ago they failed to show that the ground would be in any way damaged, inasmuch as the proposed line would not pass through any of the cricket-ground property. By the clause in the Bill, Lord's Cricket Ground would gain a distinct advantage. as the railway company would grant extensions on the south side of the ground now occupied by the Clergy Orphan Society. As the railway company had now altered the site of the terminus to the Marylebone Road the circumstances were changed. The particular clause in the Bill to which the committee of the M.C.C. have raised opposition is as follows:—"To empower the company to purchase by compulsion or agreement certain lands and property in the parish of St. Marylebone and county of London, adjoining the ground belonging to the Marylebone Cricket Club, and belonging or reputed to belong to the corporation known as the Clergy Orphan Society, incorporated by the Act 49 George III. cap. 18, and to empower and require that society to sell the said lands and property which are shown on the plans deposited as hereinafter mentioned, for such price or consideration as may be agreed, or as the intended Act may prescribe, and to enable the company to convey the same, or so much thereof as may not be required for the purposes of the undertaking of the

company, to the trustees of the Marylebone Cricket Club, in exchange for a certain portion of land belonging or reputed to belong to that club, or for rights in, over, or through such land required for the purposes of the intended railways, or one of them."

Mr. Denzil R. Onslow moved the following resolution :—"Believing that the parting of any portion of the freehold of Lord's Cricket Ground for the construction of the Manchester, Sheffield and Lincolnshire Railway would be fraught with the greatest danger to the interests of cricket generally as well as to the interests of the M.C.C., this meeting respectfully requests the committee of the M.C.C. to oppose the Bill with the utmost vigour at every stage of its progress before Parliament."

Sir Henry James, in speaking of the terms proposed by the railway company, said the company's proposals were very fair, and he failed to see how the committee of the M.C.C. had any *locus standi* in opposing the passage of the Bill.

A division upon Mr. Onslow's motion was taken. There were 65 votes for and 96 votes against the resolution, which was therefore lost.

BUILDING REGULATIONS IN LEEDS.

THE Corporation of Leeds intend to promote a Corporation Consolidation and Improvement Bill in the coming session of Parliament. The consideration of the building clauses gave rise to the following discussion, as reported in the *Leeds Mercury* :—

Cheap Builders.

Alderman Harrison called attention to clause 10, sub-section B, which states that the Corporation may make by-laws "with respect to the structure and materials of walls, foundations, floors, stairs, roofs and chimneys of new buildings, and the strength of timber and other materials for securing stability and the prevention of fires, and for the purposes of health." He pointed out that the words "and materials" and "for purposes of health" had been added since last year.

Mr. Ambler objected, as an architect, to giving power to the officials of the Corporation to fix the strength of materials. He wished to amend that clause so as to reduce the power.

Alderman Harrison thought Mr. Ambler was under a misapprehension. These by-laws would not be made by any officials. The committee would take the responsibility.

Mr. Ambler moved that the clause be omitted from the Bill.

Mr. Hannam said the clause was not intended to deal with such gentlemen as Mr. Ambler. It was intended to be applied to cheap builders. It was a very necessary clause, and he hoped the Council would pass it. If they did, they would support the Building Clauses Committee to a very great extent.

Mr. Ambler withdrew his amendment.

The Height of Rooms.

Alderman Harrison quoted section 11, sub-section 1, which was as follows :—"Every room used as a dwelling or sleeping-room (except rooms in the attic or roof) shall be 9 feet in height at the least from the floor to the ceiling, and every room used as aforesaid in the attic or roof shall average 6 feet 6 inches in height from the floor to the ceiling, and shall not in any part thereof be less than 4 feet in height from the floor to the ceiling, and no attic shall be built or erected which has not at least underneath it two storeys in height above the surface of the ground, and every dwelling-room in a basement shall be 8 feet in height at the base."

Alderman Sir Edwin Gaunt moved that the height of a dwelling-room in the basement should be 9 feet instead of 8 feet.

The amendment was lost, only nine members supporting it.

Open Spaces about Buildings.

Alderman Harrison next referred to the clauses dealing with the size and position of open spaces about buildings to secure adequate ventilation. Section 11, sub-section A, provided that between the back part of a block of houses and the block on the other side there should be a distance of 36 feet—back-yards of 12 feet to each block of houses and a 12-feet back road. That was practically the present law, and it was proposed by the Building Clauses Committee. The Streets and Sewerage Committee proposed that instead of 36 feet there should be 42 feet.

Mr. Pickersgill moved as an amendment that the back road should be 18 feet.

Mr. Ambler wished to point out what the probable effect would be as to the cost of buildings. There had been a great deal of talk about back-to-back houses, and the desirability of building none but through houses, and they were going to increase the cost of building through houses very considerably by the course they were taking. They were going to compel owners to expend at least 10*l.* per house more in the cost of land and paving the road, and in some cases it would be from 10*l.* to 15*l.*

P. A. GILBERT WOOD, 175 Strand, London.

Alderman Ward hoped that in what they did to-day they would not place a premium upon the construction of back-to-back houses in Leeds. There could be no doubt that a through house was healthier than a back-to-back house. (Mr. Battle: "That is not proved yet.") That was his opinion.

Alderman Sir Edwin Gaunt asked why they should compel people to build back-to-back houses at 4*s.* a week, or jump to through houses which would let at 8*s.*, when they could get houses at 6*s.* He thought that was a great mistake. In Burnley they were building no back-to-back houses, but they built houses which were similar, containing one room and a scullery behind. Let them try if they could not do something practical in this matter.

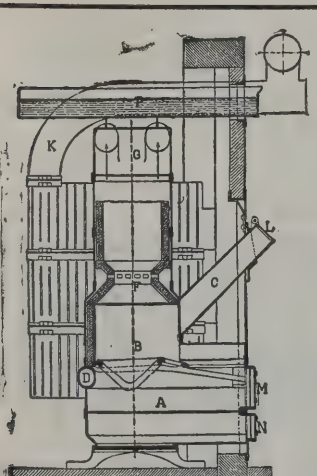
Alderman Harrison asked, in order to save time, that the Council should determine the sub-section first, the only point of difference being whether they should have a back road 12 feet or 18 feet wide. Then they could go to the question whether they would have back-to-back houses at all.

Mr. Wilson: We ought to settle whether we will have back-to-back houses in the future or not, and then go on to the conditions on which through houses should be built.

The Mayor: The matter before us is not back-to-back houses. If you pass or reject this amendment, we can proceed to the discussion of the more important matter. It is a question of making a back street 12 feet or 18 feet wide. In the process of time these roads will be declared highways, and you must bear in mind you are piling up the agony for the highway rate in years to come.

The amendment was then put and carried by 26 votes to 7.

Back-to-Back Houses.



Alderman Harrison then moved the Council's approval of two sections, which, he said, were entirely opposed to each other, but he moved the first one because it was in accordance with his own feelings. It provided that there should be only four back-to-back houses without a break, that was in blocks of eight, with, at the end of each block, a space of 15 feet in width between the buildings, and there should be the necessary conveniences erected. An alternative to this was that instead of having a space at the end of each block of eight, they might have 15 feet width from the forecourt or the front of the building, to the street. He moved that with considerable satisfaction. The alternative section was, "It shall not be lawful to erect any back-to-back dwelling-houses," and it was upon a resolution of the Parliamentary Committee that the matter came before the Council. In the first place they passed a resolution recommending the Building Clauses Committee to consider the subject. They having discussed it, declined to recommend the insertion of a clause in a Bill abolishing back-to-back houses. The Parliamentary Committee then thought that the Council ought to consider the subject, and so they put the clause in the Bill as the only means of bringing it before them. In one respect, indeed, the back-to-back house was better ventilated than through houses, for in nine cases out of ten it was built with an attic, by which a through vertical draught was secured. Then he had inquired as to the cost, and he found that the modern back-to-back house could be let at a rent of 3*s.* 9*d.* to 4*s.* 6*d.* per week, and that he believed was overstating the case; while a through house could not be built and let at less than from 5*s.* to 6*s.* 6*d.* per week. No working man with a family would be able to occupy exclusively a through house at that rent; and if they decided to have no modern back-to-back houses in the future, it almost of necessity followed that two families would take the through houses. That was done in other towns, and the landlord increased the rent because of the second family; and if such were to be the alternative, by all means let them have the modern back-to-back house.

Alderman Ward stated, on the authority of more than one architect in Leeds, that it was possible to give a thoroughly good through house, containing, in every respect, accommodation equal to a back-to-back house, for a rent of 4*s.* 6*d.* a week. He thought the time had come when they should, as far as possible, encourage the building of through houses; and, with the view of testing the question, he would move that the clause be adopted, and that for the future they forbid in the borough of Leeds the erection of back-to-back houses.

Mr. Leuty moved the following amendment:—"That the Council ask for power to refuse to pass any plan for the erection of back-to-back houses; but if such plans be passed there shall be provision made in the Bill for securing the provision of attics, and a 42-feet street on each side, but through houses may be built in blocks of six, with a 36-feet street both back and front." He was not prepared to go in for a drastic resolution against the erection of back-to-back houses whatever might be the circumstances. If the Council proceeded on the plan he suggested they would have the power in their own hands.

After a discussion, a vote was taken on Alderman Ward's amendment, that "it shall not be lawful to erect any back-to-back dwelling-houses." Only four members supported the amendment, which was lost.

Portable Cistern Filters.

157 STRAND, W.C. (Four Doors from Somerset House) LONDON.

Mr. Leuty's amendment was next voted upon, and met with six supporters. It was, therefore, rejected.

The resolution was then adopted, with a rider moved by Alderman Harrison to the effect that, in addition to the other provisions with regard to through houses, such houses may be erected fronting a 14-yards street on the same principle as back-to-back houses, as set forth in Sub-section E of Section 11.

The Drainage of Buildings.

Section 17 is as follows:—"No house or building shall be erected or rebuilt unless the level of the lowest floor shall be of a sufficient height to allow of the construction of a drain from such house or building to empty into some sewer belonging to the Corporation, and for that purpose the levels shall be taken and determined under the direction of the borough engineer."

Mr. Hannam said he was quite willing that this section should be adopted in its entirety, but the Corporation itself was very inconsistent in carrying it out. The Building Clauses Committee said this clause must be carried out, but the Sanitary Committee in a year or two would say they did not approve of this, and that they wanted the gullies and everything else brought up to the surface. It was very hard upon property owners.

Alderman Harrison, in reference to a point raised by Alderman Firth, agreed to insert the words, "where such drain exists."

Mr. Winn suggested that the Building Clauses Committee and the Sanitary Committee and the borough engineer might consult together upon this matter with very great advantage.

Mr. Hannam said a sub-committee had been appointed from the two committees to consider the question, and try to bring about harmonious action.

The clause was adopted.

Section 18, which provided that houses should not be built below the level of the ground without areas, and section 25, which referred to the erection of temporary buildings, were struck out.

Provisions as to Hoardings.

On section 26, which contains provisions as to hoardings:—

Alderman Emsley moved "That no hoarding belonging to the Corporation shall be let or used as a bill-posting station."

Alderman Bower did not see why the Corporation should not have power to let these stations if they liked.

The amendment was lost.

Alderman Firth moved to reinsert sub-section 3, which had been struck out. It was as follows:—"No advertising board, placard, notice or any advertisement whatever shall be allowed to be affixed to or posted on such board or fence without the consent of the Corporation."

The amendment was negatived.

Sections 27 to 44, completing the proposed building regulations, were adopted.

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.*]

APPLICATIONS FOR PATENTS.

20302. Edward William Sant, for "Improvements in safety apparatus for hoists or lifts."

THE SANITARY INSTITUTE.

AT the last sessional meeting of the Sanitary Institute, a paper on the sewerage of Maldon, Essex, with some observations on recent practice in sewer ventilation, was read by Mr. Richard F. Grantham, C.E. The lecturer described the construction of the sewers at Maldon and the means adopted to take the sewage away from the town. In dealing with the ventilation question, Mr. Grantham said the primary conditions now fully recognised, which could not be too strongly insisted upon, for preventing the accumulation of foul air, were sufficient falls in the sewers, construction of the best kind, proportions to suit the expected volume of sewage so as to give a self-cleansing velocity, flushing where necessary, and as many openings into the outer air as practicable. Destructors, involving the burning of gas, had been and were now being used, but so far the results had not been better than those obtained from the simple shaft. Recent investigations and experiments had shown that tall shafts carried well above house-tops caused an improvement in the air of sewers. Connection with tall furnace chimneys had been tried, and a powerful current thereby induced, but its effect had been found to be destroyed when there were many inlets in the sewer, a current of air being drawn with great force through them. The position of the pipe shafts must be most carefully chosen and carried up to a proper height, but any risk of nuisance was obviated by there being a good number of them. In the examples and experiments mentioned by the lecturer there was, he said, a unanimity of opinion and practice in regarding upcast shafts as necessary adjuncts to sewers, but he did not go so far as to advocate the abolition of open gratings at the street level over manholes and lampholes, inasmuch as with a sufficient number of shafts the gratings would act as air inlets. Any material or contrivance introduced into the manholes or shafts through which sewer air passed had served only to retard the passage of the air without a sufficiently compensating advantage. The practice of establishing upcast shafts was increasing, and probably in the course of time would be generally adopted. The lecturer added that he believed with improved conditions in course of time the two systems of ventilation, one for the main sewer and the other for the house, might be amalgamated, and syphon traps in the house drain outside the house might be omitted. A discussion followed, and a vote of thanks to the lecturer for the paper was passed.

MAKING-UP STREETS.

AT the Tunstall Stipendiary Court, Mr. John Grosvenor, builder and contractor, and a member of the Board of Health, was summoned at the instance of the Tunstall Board for the recovery of 56*l.* 8*s.* 11*d.* for private improvements. It was stated that the defendant built a number of houses in Henry Street, and on May 3, 1889, the medical officer reported that the condition of the street was unsatisfactory. On the recommendation of the Sanitary and Highways Committees the property-owners, including the defendant, were called upon to put the street in order. This they failed to do, and the Board accordingly accepted a contract for the carrying out of the work, and apportioned the cost amongst the owners, the defendant's share amounting to the sum claimed. Mr. Grosvenor claimed that he was not liable on account of work previously done to the street; but the Board contended that the street never was put into a condition that would justify them in taking it over.

Mr. A. R. Wood, surveyor to the Board, stated when the owners were called upon to do the work the street was in a bad state, only partially sewered, and not in a condition to give satisfaction to the Board. What had been previously done to it was only sufficient to satisfy the Building Committee in allowing the defendant to proceed with the erection of his houses.

Mr. J. Lobley, borough surveyor of Hanley, and Mr. R. Dain, surveyor, gave evidence that it was the practice that before houses were erected in a street, such street was required to be made for the purpose of the buildings, and then, when it was thought that the street would be useful to the public, Section 150 of the Public Health Act was put in force, requiring the owners to make the street in such a way that it could be taken over by the Local Authority. A street as formed for building purposes was not in the condition required by Section 150, and frequently the work done previous to building became so worn that it had to be done over again.

For the defence, it was submitted that, though this might have been the practice, the law did not require work of this class, which was once done to the satisfaction of the authority, to be done a second time.

Mr. Grosvenor stated that when the street was made in 1874 it was properly made in accordance with the by-laws, and in 1889 his portion of the street was as good as it was after the work had been done by the Board.

The Stipendiary held that the defendant was liable, and ordered the amount claimed, with costs, to be paid within a month.

BUILDING AND BUILDERS.

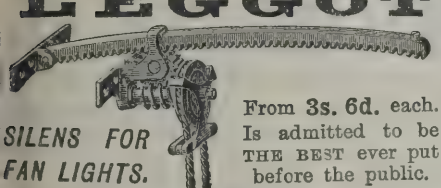
THE Chairman of the Great Eastern Railway has announced that 30,000*l.* is to be expended on cottages for signalmen, porters and other employés.

NEW classrooms in connection with Bunyan Meeting Sunday Schools, Bedford, were opened by the mayor of Bedford (Dr. Combs, J.P.), on Thursday, December 10. The works have been carried out from the designs and under the superintendence of Messrs. Usher & Anthony, of Bedford, the architects, by the contractor, Mr. J. P. White, at the cost of about 1,300*l.*

AT the meeting of the Leith Dean of Guild Court warrants were granted to Mrs. Thompson, to erect a warehouse at the corner of a new street to be formed between Elbe Street and Assembly Street; and to Messrs. T. & A. Nicoll, to erect a tenement of dwelling-houses in a new street to be formed running off the Lindsay Road.

AT the meeting of the Hospitals Sub-Committee of the Sanitary Committee of the Leeds County Council, it was resolved to take steps to secure a site, about twenty acres in extent, upon which to erect an hospital for infectious diseases.

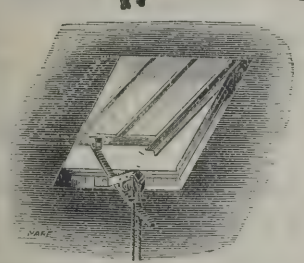
A RESOLUTION in favour of building a public hall for Walsall was agreed to at the meeting of the Town Council.



PLANS for a new public hall and municipal offices for Conway, prepared by Mr. T. B. Farrington, have been adopted and referred to a committee to obtain estimates.

A MOVEMENT has been started to raise 2,500*l.* to rebuild the tower of Great Chesterford Church upon the site of a tower which existed some centuries ago, the foundations of which have been recently discovered.

PLANS, prepared by Mr. E. E. Scrivener, architect, for the enlargement of the Fenton, Bagnall and Harpfield schools have been approved by the Stoke-on-Trent School Board.



THE annual general meeting of the members of the Cardiff Master Builders' Association was held at the Angel Hotel, Cardiff. There was a large attendance, the chair being occupied by Alderman David Jones. The report and balance-sheet for the year were presented and passed. They showed a very satisfactory state of affairs, and gratification was expressed at the strength of the Association, which now numbers close upon fifty, including the principal builders and contractors of the town. Alderman David Jones was re-elected president, Mr.

MANUFACTURERS TO H.M. GOVERNMENT.

THE "ECLIPSE" PAINT REMOVER & CLEANSER.
The Best, Cheapest, and Most Effective in the World.
1A CRESCENT, MINORIES, LONDON, E.C.

F. S. Lock, vice-president, and Mr. S. Shepton hon. treasurer. The retiring committee was also reappointed.

AN inquiry has been held in regard of the application of the Elland Local Board to the Local Government Board for permission to borrow 2,000*l.* for the erection of a fire-brigade station, &c., and 500*l.* for works of sewage. Messrs. Horsfall & Williams, of Halifax, are the architects of the proposed buildings.

AT the meeting of the Lichfield Board of Guardians a letter was read from the Local Government Board enclosing orders for the erection of a new dining-hall, &c., at a cost of 3,500*l.*

IT is stated that the railway-station and telegraph offices at Valparaiso have been destroyed by fire, the damage being estimated at 500,000 dollars, and that a terrible storm of wind has passed over the city, wrecking many buildings.

THE Halifax Corporation have received from the Local Government Board sanction to borrow 6,820*l.* for the erection of baths at Haley Hill, and the Waterworks Committee have resolved to proceed with the work according to Messrs. Horsfall & Williams's plans.

AT the meeting of the Kirkcaldy School Board, Mr. M. B. Nairn, chairman, offered to extend and fuily equip the Burgh School with gymnasium and workshops, to make it a secondary and technical school. The cost of providing the proposed school is estimated at from 6,000*l.* to 7,000*l.*, and the Board is allowed till March to accept the offer.

MR. COYNE, superintendent, in his monthly report to the Edinburgh and District Water Trust, states that the number of pipes laid during November was 109, of which 58 were extensions of the system. The number of apparatus examined for checking waste was 30,469, of which 962 were found faulty or in a state of disrepair.

AN extensive range of offices is now in progress at the St. Vincent's Ironworks, Bristol, for Messrs. John Lysaght, Limited. The frontage will be over 100 feet, with a depth of 60 feet. The two main façades will be of Doulting stone, and when completed will be a conspicuous improvement to the district. The plans have been prepared by Mr. R. Milverton Drake, architect, of 24 College Green, Bristol, under whose supervision the work is being carried out.

IN a report to the Shrewsbury Town Council the Public Baths Committee recommended an alteration in the accepted plans for the new public baths which would effect a saving of 500*l.* in the cost of erection, and to diminish the cost of subsequent management. The first-class swimming-bath would be reduced in area to 2,250 feet, and the second-class enlarged to 2,700 feet, both being 10 yards wide. Private baths for both sexes would also be provided. The cost was estimated at 6,500*l.* with the alterations proposed, and 4,000*l.* would have to be borrowed. The report was adopted.

TRADE NOTES.

THE London County Council has just ordered a new Merryweather steam fire-engine, which will be stationed at Woolwich, the furthest station from headquarters in the South-Eastern district. The machine will be similar to sixteen already in use by the Metropolitan Brigade, and made by the same firm.

THE new Board Schools, Grimsby, are being warmed and ventilated throughout by means of Shorland's patent Manchester grates and vertical inlet brackets, the same being supplied by Mr. E. H. Shorland, of Manchester.

SOME very expeditious work has been recently carried out at the French Gallery, Pall Mall, by Messrs. Frank Suter & Co., 66 Berners Street, W. This firm commenced work on Friday evening, the 11th inst., at five o'clock, and had entirely completed the installation of their system of picture-lighting by ten o'clock the following morning. We understand that the system adopted is similar to that employed by the same firm in the galleries of Messrs. Tooth, Messrs. Maclean and Messrs. Dowdeswell.

MESSRS. ARCHIBALD SMITH & STEVENS are supplying to the University College at Nottingham, for the use of the students, a set of hydraulic machinery, comprising one of their "Reliance" lifts, a set of high-pressure pumps and an accumulator. The latter will also supply water for an hydraulic testing machine. The same firm have had the passenger lifts at the Grand Hotel, Eastbourne, placed in their hands for overhaul, and in one case partial reconstruction. A new pumping engine and hydraulic accumulator form part of the new scheme. A similar set of hydraulic power machinery, together with two "Reliance" passenger-lifts, are also in hand for the York Street Property Company, Manchester, the lifts being of same construction as that just erected by the same makers at Lloyd's House, Manchester. "Reliance" passenger-lifts are also in progress for five separate buildings on the sea-front at Brighton.

Awards—Gold Medal, Saltaire, 1887; Silver Medal, Brussels, 1888; Silver Medal, Paris, 1889; Gold Medal, Brighton, 1889

TO ARCHITECTS AND BUILDERS.

Fountain Street, Bury, and Shiffnall Street, Bolton:
February 13, 1891.

Gentlemen,—We have pleasure in announcing that we have opened extensive Show Rooms at 117 QUEEN VICTORIA STREET, LONDON (opposite Civil Service Stores).

We have been very successful in Lighting and Ventilating Public Buildings in all parts of the Country.

We have a large stock of Sunlights, Turrets, Exhaust Roof Outlets, Tobin's Tubes, Air Grids, &c., &c., at our Show Rooms.

We feel confident that our **DESIGNS**, as well as our system of Lighting and Ventilating will commend themselves to all who are interested in having BRILLIANTLY LIGHTED and WELL-VENTILATED ROOMS.

A visit to our Show Rooms will be esteemed a favour. If inconvenient to call, send for one of our Illustrated Catalogues, inspect our Designs, and read our Testimonials.

Trusting to receive your favours, which shall have our prompt attention,

We remain, Gentlemen, yours obediently, J. H. PICKUP & CO.

for Warneford Hospital, Leamington; and in London for Talbot House, Arundel Street; Geo. Newnes & Co., Limited; New Travellers' Club; St. George's Club; St. Ermin's Mansions; Ashley Gardens (sixth machine ordered); Continental Gas Association; Royal South London Ophthalmic Hospital; Hereford Mansions; Compton House; and six for the Imperial Institute, with other lifts, pumping engine and accumulator. A large hydraulic balance lift is in course of erection, under Stevens & Major's patent, at the offices of the North British and Mercantile Assurance Association.

THE ventilation of the Lochwinnoch Schools has been entrusted to Messrs. Baird, Thompson & Co., ventilating engineers, London and Glasgow.

AT the meeting of the Kirkintilloch Police Commissioners, a communication was read from Mr. Copland, C.E., Glasgow, relative to the South Lenzie drainage. The proposed ventilating shafts would, he stated, carry the air from the sewers over the heads of the people, but under certain atmospheric conditions the sewer-gas escaping from the ventilating shafts would descend. He did not wish to be understood as saying that ventilating shafts would make no improvement, but merely that they must not be relied on to cure the smells.

SCHEDULES for work in connection with the erection of a new railway station at Grahamston, Falkirk, have been issued to several of the local tradesmen asking them to send in estimates. The building will include ticket-offices, waiting-rooms, agent's house, &c. A covered-in platform will be formed on the south side of the railway extending to about 180 feet, while on the north side a platform, also covered in, will extend to about 100 feet.

THE Leeds Waterworks Committee have resolved to increase the reservoir at Moortown to double its present size, and the contract of Messrs. Gould & Stevenson, Hunslet, to do the work has been accepted. The improvement will involve an expenditure of over 4,000*l.*

AT the meeting of the Conway Town Council Mr. T. B. Farrington, the borough surveyor, submitted a report with reference to proposed improvements and additions to the gas-works at an estimated cost of 2,000*l.*

A VERY useful little diary and almanack for 1892 has just been issued by Messrs. Chubb & Son, of 128 Queen Victoria Street, E.C. It contains the usual almanac, information, and a diary, three days to the page. It is well bound in morocco and gilt-edged.

VARIETIES.

MR. W. P. BUCHAN, the well-known master plumber of Glasgow, has just been admitted to the Freedom and Livery of the Worshipful Company of Plumbers.

THE Blackpool Tower Company have completed the purchase of the Aquarium site, and possession of the land and buildings was formally handed over to them. Owing to a firm having failed to fulfil their agreement, the Tower Company have saved the sum of over 21,000*l.*, and the price paid for the site is 72,800*l.*, instead of 94,000*l.*, as stated in the prospectus. The contract for the foundation works had been let to Messrs. Robert Neill & Sons, contractors, Manchester.

WE have much pleasure in stating that the net proceeds of the entertainment given at the Prince's Hall by Mr. and Mrs. F. T. Davies, for the benefit of the poor of St. Pancras, realised the substantial amount of 305*l.* 2*s.* 6*d.*

A BILL which will come before Parliament in the next session seeks for power to execute further experimental works in connection with the Channel Tunnel, vesting in the Lords of the Treasury the sole right of determining the expediency of continuing such works, subject to such conditions, restrictions and requirements as they may prescribe. It is also provided that in the event of such experimental works proving successful, the Channel Tunnel Company may be required within ten years to sell them to the Lords of the Treasury. The Bill also provides for the South-Eastern and London, Chatham and Dover Railway Companies participating in the execution of the work, whether experimental or permanent.

DURING the progress of the work of restoring Crowland Abbey, Lincolnshire, an interesting discovery has been made. The workmen were about to remove a decayed stone, to replace it with a sound one, when they discovered that the walls between the buttresses consisted of only thin casings of stone built over an older wall, which was completely covered with panelling similar to that on the interior of the west wall of the tower. A good portion of it has been laid bare, and will be undoubtedly preserved. The tower of this historic building has now been made safe from its very foundations, which have been under-built; while the spiral stairs, the bearing arches which carry the steeple, and the porch, with the King's chamber, are all secure. The preservation of the bell-chamber is about to be undertaken, with the necessary work for putting the fittings of

2 VICTORIA MANSIONS, 28 VICTORIA STREET, WESTMINSTER, S.W.

the bells in a safe and workable condition. When this is accomplished, the beautiful Early English doorway into the nave, with its legendary sculptures, is to be attended to.

AT a meeting of the Grays Local Board a deputation was received from the Orsett Guardians asking the Grays Local Board to receive the sewage from Tilbury, and deal with it at their proposed new sewage disposal works. After discussion it was agreed to receive and deal with the Tilbury sewage subject to terms to be arranged afterwards. Tilbury will contribute an annual payment in proportion to population or volume of sewage. The chief terms necessary to form the basis of an agreement have been drawn out by the engineers to the two authorities. Mr. W. H. Radford, C.E., of Nottingham, is the engineer for the new disposal works and sewers at Grays, and Mr. C. Jones, C.E., of Ealing, is the engineer for the Tilbury sewers.

THE Local Board of Honley, in Yorkshire, have instructed Mr. W. H. Radford, C.E., of Nottingham, to prepare plans and superintend the construction of certain intercepting main sewers with sewage disposal works for the township of Honley. A large amount of dye-water and manufacturers' refuse will have to be dealt with. The local board surveyor, Mr. George Kaye, will prepare plans of the lateral sewers in the town and connect them to the intercepting sewers mentioned above.

THE work of installing the electric light in the Mansion House has been completed. This is the first time in which the Lord Mayor's official residence has been entirely lighted by electricity, and the various reception and state apartments will appear to great advantage on occasions of entertainment.

A LOCAL Government inquiry has been opened as to an application of the Birkdale Local Board to borrow 18,960*l.* for works of sewage disposal, surface drainage, and street improvements.

THE death is announced of Mr. Dugdale, engineer to the Chester Waterworks Company.

WE learn with satisfaction, the *Irish Times* says, that the Christ Church Improvement Fund is so far advanced that the work will now begin, and when finished the locality will be greatly benefited as well as beautified by the change.

IN an account given by Mr. T. Abbott of his first year's experience on the Manchester Town Council he said that the Unhealthy Dwellings Committee had dealt with 413 houses, of which 252 had been ordered to be closed, 2 entirely demolished, 18 were considered worth repairing, 93 adjourned for further consideration, and 48 purchased for the extension of the spaces round the houses in the more congested district in the interest of the health of the inhabitants. There were still in the city 9,240 back-to-back houses to be dealt with—houses which in their present state were totally unfit for human habitation. He regretted the delay that had taken place in the erection of dwelling-houses for the working classes to take the place of those that had been pulled down, but from what he knew of the selected plans he believed that the houses when they were erected would be attractive externally, and that they would be fitted up and finished internally in such a way as would satisfy the most fastidious working-man in Manchester.

ON the recommendation of the Bridges Committee, the London County Council resolved that two resident engineers be appointed, at a salary of 600*l.* a year each, to supervise the works in connection with the construction of the Blackwall Tunnel, and that the matter be referred back to the Bridges Committee, with instructions to submit the names of two persons in their opinion best qualified to fill the appointments.

AT the closing meeting of the autumn term of the Birmingham Pen and Pencil Club, Mr. Jasper Hunt, president, in the chair, a paper on "Ecclesiastical Woodwork" was read by Mr. Christopher Silk, who, owing to the scarcity of good local examples, confined his references to Somersetshire churches, which are particularly rich in fine specimens of early work. Having traced the development of the rood-screen, Mr. Silk described the grotesque treatment of the miserere seats and pew-heads.

AT Boston, during the late gale, the fine old parish church sustained injury. About a ton of the leads on the roof of the south-west corner of the church was dislodged, and a large quantity of the stone coping was blown down.

THE Filey Local Board have made final arrangements for the new sea wall and promenade. The Local Government Board has sanctioned a loan of 10,500*l.* for the purpose. The plans of Messrs. Fairbank & Sons, Driffield, have been adopted. The sea wall and promenade when completed will extend from the Ravine to the southernmost point of Crescent Hill, a distance of 700 yards.

CONSEQUENT on the recent discussions and negotiation, the Manchester Ship Canal Company have ceded the general control of the remaining works of construction to the Manchester Corporation, by the formation of a joint executive committee of seven, on which the shareholders' directors number three,

OPENSHAW, MANCHESTER.

while the Corporation representatives are four, one of them, Sir John Harwood, being appointed chairman. The intention is to have as much as possible of the work done by contract.

IN the course of the demolition of the remains of the ancient church of St. Martin's-le-Grande, at Dover, the workmen came upon two chalk graves of great antiquity. In one of the graves a beautifully-wrought silver chalice and paten were found, which are believed to indicate the interment of some great ecclesiastical dignitary of the Church many centuries ago. The church of St. Martin's-le-Grande was built in the early part of the seventh century, on the foundation of some ancient Roman baths.

THE Bradford Board of Guardians intend to apply for borrowing powers to the extent of 8,000*l.*, for the purpose of providing a new ward for imbeciles at the workhouse.

THE Huddersfield Town Council have appointed Mr. Mountain, of Newcastle-on-Tyne, electrical engineer to the Corporation.

CHICAGO EXHIBITION NOTES.

THE monster Manufactures and Liberal Arts Building requires more than 200 car loads of lumber, or 3,000,000 feet, for its flooring alone, and five car loads of nails to fasten it down. Three electric saws are kept running night and day sawing and sizing the flooring. Twenty buildings of the size of the auditorium, or 1,000 houses 25 by 50, could stand on this mammoth floor.

MEDUSALINE, a new composition designed as a substitute for brick and building stone, has been adopted for the sidewalks and driveways in the exposition grounds. The Committee on Grounds and Buildings granted the contract to the Medusaline Manufacturing Company of Chicago for the construction of 450,000 square feet of such sidewalks and driveways. The price is 6½ cents per square foot. The concrete composition to be used by the contractors is said to be as hard as perfect stone, and it is now thought probable that it will be used instead of staff for the exterior ornamentation of the Fine Arts Palace and several other buildings.

WYOMING'S building at the Fair will be of the French château style of architecture, 50 by 70 feet, two storeys high, and will cost about 20,000 dols.

THE great dome of the Administration Building, which will be the most conspicuous architectural feature of the exposition, and the four smaller domes, will be covered with aluminium bronze, a newly discovered amalgam, which is said to glisten brighter than gold. The contract for gilding the domes has been let for 54,000 dols.

CEYLON has sent, through Sir Henry Wood, a request for space upon which to build a tea-house.

NEARLY 700,000 dols. of insurance has already been placed on the exposition buildings in process of erection.

DIRECTOR-GENERAL DAVIS has made a report to the Committee on Awards in which he says that 142 juries, embracing 659 jurors or judges, will be necessary at the exposition. He believes that appointment on these Juries of Award will be considered a high honour, and that a better class of jurors will be secured if no salary is offered. He recommends, however, the payment of six dollars a day to each juror in lieu of expenses. He thinks a prize of 500 dols. should be offered for the best design for a medal, two prizes of 250 dols. for the next best two designs, and like prizes in case of designs for diplomas. The Government is expected to appropriate about 500,000 dols. for carrying out the awarding of the medals and diplomas. It is hoped, too, that the medals will be struck in the Government building at the exposition, and the diplomas will be prepared in the Bureau of Engraving and Printing at Washington.

MR. SALLUS, an artist of Ecuador, will execute especially for the World's Fair two paintings, one a scenic painting of Chimborazo, and the other a life-size portrait of Columbus.

THE party which, under the direction of Chief Putnam of the Department of Ethnology of the exposition, has been making excavations of the mounds in Ohio for three months or more, met with rare success on November 14 near Chillicothe, in making one of the richest finds of the century in the way of prehistoric remains. While at work on a mound 500 feet long, 200 feet wide and 28 feet high, the excavators found near the centre of the mound, at a depth of 14 feet, the massive skeleton of a man encased in copper armour. The head was covered by an oval-shaped copper cap, the jaws had copper mouldings, the arms were dressed in copper, while copper plates covered the chest and stomach, and on each side of the head, on protruding sticks, were wooden antlers ornamented with copper. The mouth was stuffed with genuine pearls of immense size but much decayed. Around the neck was a necklace of bears' teeth set with pearls. At the side of this

skeleton was a female skeleton, the two being supposed to be those of man and wife. It is estimated that the bodies were buried fully 600 years ago. The excavators believe they have at last found the king of the mound builders.

THE Polytechnic Institution, Regent Street, London, intends to conduct a series of excursion tours to the World's Fair for the accommodation of people in moderate circumstances. It has now contracted with the Inman Steamship Company, which owns the *City of Paris*, *City of New York*, and other fast steamers, to transport parties weekly.

COMMISSIONER MCCORMICK writes from London that Mr. Armstrong will soon arrive in Chicago, his purpose being to present to the authorities of the exposition a project to reproduce the Tower of London.

DANIEL C. FRENCH, the New York sculptor, is now in Paris working on a colossal statue of the Republic for the World's Fair. It will show a female figure nearly 70 feet high.

THE American sculptor, MacMoines, is also in Paris working on the great fountain which will be placed in front of the Administration Building. The fountain will have thirty gigantic figures.

INCANDESCENT GAS.*

IT is now about seven years ago that the Austrian Doctor of Chemistry, Dr. Auer von Welsbach, completed his experiments in utilising some of the rare earths for lighting purposes, and about five years ago his invention was first introduced in this country. No doubt some of you know of what his invention consists. It has long been doubted whether the ordinary method of using gas directly as an illuminant is either the best or the most economical, and a long time back those best acquainted with gas-lighting came to the conclusion that the gas should not be used as a direct illuminating flame, but that the proper form of utilising it should be through its heat; the great objection, however, to this course was the difficulty in finding materials which could be brought to incandescence by ordinary pressure with very small heat, and the production of such a lamp as would carry out this idea. There are various inventors who, from 1820 to the present time, have been employing their brains on finding out means for solving this most difficult question, but I do not hesitate to say that all these systems brought out failed very soon, and none of all the incandescent gas-light systems have stood the test of time so well as the invention of Dr. Auer's. In giving you the outline of his invention, I may mention that Dr. Auer was a pupil of Professor Bunsen in Heidelberg, and it is under that eminent savant that Dr. Auer studied the rare earths, and learnt how to treat them and extract them, and the spectroscope is almost the only and the surest guide in the test of the purity of these rare earths. Dr. Auer made zircon and lanthan his special studies, and he was the first who discovered that yttrium was not an element, but was split into Brassidimium and Needimium. He soon found out that the heat-resisting property of all these earths was enormous, and he worked out a combination by which several of these rare earths, used in a hood of cotton, produced with a small Bunsen flame a brilliant light, and it was in this form that the incandescent light was introduced into this country. When, in 1887, the Incandescent Gas Company was started, there was an enormous rush for the light, which proves that an improved gaslight was at that time a greatly-felt want. Business went on in a very satisfactory way for about three months, and then the troubles of this company began. When first supplying the English public with a mantle or hood, this mantle was saturated with a fluid made out of the above-mentioned rare earths in such a proportion that these mantles gave a brilliant white light for about 800 hours without any decrease of light; but there was one of the chemicals used at that time which could only be obtained in small quantities, and in supplying lamps in England for about three months Dr. Auer had run out completely the stock of the material that is the most heat-resisting, and the company had to fall back upon a combination of these rare earths, which would give a perfectly good light for two hundred to three hundred hours; but then the decrease in the light was so great that after that time the light decreased; and turned into a reddish sort of colour, which was only very little better than ordinary Argand burners. In consequence of this fact the system got a very bad name, which, with the bad management of the company at that time, was the reason that instead of making a steady advance the incandescent light became less and less a favourite with the public. In the meantime, researches after the material we use for this fluid have proved that there is plenty of it, and that the metals we require are so plentiful that any amount can be obtained; and having pro-

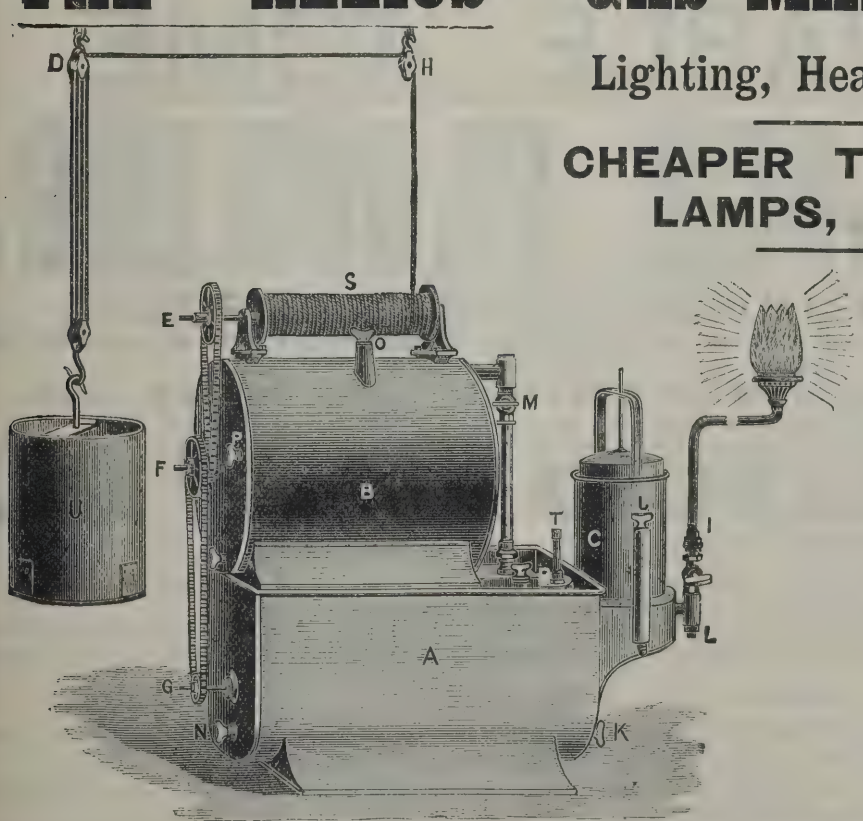
cured a good supply of each of them, the company about two years ago began to make the fluid according to the original receipt of Dr. Auer, and we must state that from that date the incandescent gas light has made a steady but sure advance, and the fact that from September to December last year we sold nearly 20,000 lamps proves that the system has many friends now. These mantles we have supplied for the last two years have a capacity of 25 to 28 candle-power, and they would burn without much decrease in light for about eight hundred hours. To-day I have to draw your attention to an invention which has been made by Dr. Auer, which will make our system one of the most economical and efficient amongst the various ways of illumination. Dr. Auer has succeeded in finding a rare earth, whose fire-resisting power is so great that no known heat is able to melt it, and this material, in connection with our hood, produces an incandescence that is absolutely startling. To give you a fair idea of the lighting capacity of this new mantle I will compare this new light with some of the best-known other systems in the market, and to show you that I do not mean to put figures as to candle-power before you which I cannot substantiate. I have all these burners on the ramp before me, and you may compare them for yourself if you like. We have in the testing-room of the laboratory a photometer, and those of you gentlemen who would like to make photometrical tests of our light and the others I show you are invited to let me know, and I will put the photometer at their disposal with the assistance of our chemist, Mr. Mackean. To begin with, I have an ordinary Bray's burner, No. 6, and with a pressure of 1 inch this burner passes per hour 7·5 feet of gas, and with our London gas this would give no more than 14 candle-power of light. The next burner I have here is a large Argand burner. This gives at 1-inch pressure, with 7·5 feet of gas per hour, 26 candle-power, so you see that the consumer gains already 12 candles from the same amount of gas if he uses an Argand instead of a Bray's burner. A third burner is our Welsbach burner as sold up to the present moment. This burner passes 3 feet of gas, and with this 3 feet of gas gives about 25 candle-power of light, and the durability of the mantle I would average at 800 hours. Here you find already that with our lamp you get an equal amount of light as with the Argand burner, with the difference that we use only 3 feet of gas where the ordinary Argand burner uses nearly 8 feet. The next lamp is our new light, which we are able to introduce to the public. This burner passes 3 feet of gas, like our old Welsbach burner, and the candle-power obtained on the photometer is equal to 60 candles with 1-inch pressure. If the pressure is always six-tenths to nine-tenths, we do not get the same amount of light, but still we are able to get with the six-tenth pressure of gas about 35 to 40 candle-power. The mantle that is on this burner will give this light for from 2,000 to 3,000 hours. After having burnt 2,000 hours, then the light begins to diminish, and between 2,000 and 3,000 hours the light would vary from 60 to 50 candle-power; but for practical purposes even 40 candle-power would be called a brilliant light, and 50 candle-power can certainly not be termed otherwise than splendid. I have compared up to now our light only as regards illuminating power, and if you consider the cost of the same, you will find that though at first the expense for putting up our lights is rather considerably more than, for instance, Argand or Bray's burners, or any other gas burners in the market, the saving of gas with our light is so enormous that the first outlay pays itself in a very short time indeed; and we have found that all those who have studied our light carefully, and who had a sufficiently large installation, are in every way satisfied with the light. If you take it only that our burners consume only half the amount of gas against other burners, the saving would be about 50 per cent. in the gas bill; against this must be reckoned the expense of the lamp and the mantles, and on an average each burner costs a householder about 1*l.* a year, so that there is a saving with our light to the amount of about 10*s.* per burner, less one or two mantles. But I beg to point out to you that there is an actual saving to a large amount in the gas bill, where for the same amount of money you get a better light, a purer light and a steadier light.



No doubt you will say that with the enormous strides electricity has made for the last few years that this invention comes a little late in the day, but here, again, I myself am very hopeful, and I do not doubt that electricity will find in this light a most serious competitor. The electric incandescent lamps give on the average 18 candle-power, and although it is very difficult indeed to obtain an estimate for the actual working expenses of an electric installation, we have found out, part through our own customers and part through information from electric engineers themselves, that the cost of electricity against our light stands about 10 to 1. If a place with 500 lamps had to be installed with electric light it would cost about ten times as much to put the lights in and to keep them going as our own lights would. We would give with our own lights on an average of 60 candle-power a total lighting power of 30,000 candle-power, whereas an electric incandescent lamp at an

THE "HELIOS" GAS-MAKING MACHINE

FOR

Lighting, Heating, and Motive Power.

CHEAPER THAN COAL GAS, OIL LAMPS, OR ELECTRICITY.

This Machine is the latest development of the Oil Gas systems. In most other such machines Gasoline is the gas-producing material, and as this can only be procured in large quantities, and is dangerous to store, there is naturally a great objection to its employment. The "Helios" Gas Machine is charged with Benzoline, which can be procured anywhere in large or small quantities. The Machine is simple, and the light produced far superior to coal gas. Machines made to supply from 6 to 2,000 lights.

Prices from £10 10s.

UNEQUALLED FOR

COUNTRY HOUSES, FACTORIES, HOTELS, &c.

FOR FURTHER PARTICULARS APPLY TO

THE INCANDESCENT GAS LIGHT CO., LIM.

14 PALMER STREET, WESTMINSTER, LONDON.

average of 18 candle-power in the same rooms would only give an illuminating power of 9,000, which would mean that we give about three times the amount of light that electric light would be able to give. Our lamp, as it stands before you, is constructed in such a way that anybody can fix it up, and there is no trouble whatsoever in keeping the light in order. The burner is simply screwed on to an ordinary gas-fitting, the mantle is fixed on, after which the mantle is burnt off to free it from certain chemicals, which render it more resisting against breakage in travelling, after which the chimney is put on, and the mantle will begin its duty as a light. I may mention that at the present moment we have sufficient material on hand to manufacture these lights in any quantities, and failing or breaking down of the system as in 1888 is at the present moment impossible, and we look forward, though we know perfectly well that we have to overcome enormous difficulties, to convert the prejudice that still clings to our old incandescent system. We are certain that in the long run we will succeed in introducing our system not only into the better houses and places, but ultimately into every household where a cheap pure light is desired. It need only be known amongst the general public that the advantages of our system are to the extent stated to you before, when they will surely come to use the light, and we on our part shall do everything to study the wants of the public, and we shall try to satisfy them as far as we can.

I come now to another matter which it is not very pleasant to touch, that is, gas companies. We find out that gas companies in general are dead against our light, because the consumption of gas with it is reduced to such an extent that if our light was generally adopted to-day all over England, it would certainly lead to an enormous falling off in the revenues of the gas companies : but this fear is quite unjustified, because we have found the demand for light increase, and for this reason gas companies would have very little to fear.

I have now given you pretty nearly as much information as I think will interest you, and before concluding I should like to say a few words about our "Helios" gas-making machine. It is now about six months ago that we introduced this machine for the purpose of lighting country houses, factories, hotels which are out of reach of ordinary gas companies, and which cannot adopt electricity on account of the expensive installation, and we are very happy to state that up to the present we are very successful with the machine. You all know that if the lighter hydrocarbons are brought in contact with a draught of air that they will vaporise and give off a mixture of air and hydrocarbon, which has a great illuminating and heating power. The machine you see here contains in the top part a blower or an ordinary meter-wheel, which sucks in the air and forces the air into the tank, which contains a revolving carburettor. In passing through this carburettor the air vaporises, a certain amount of this hydrocarbon goes out through a tube as a so-called gas mixture, which we use for lighting purposes. Downstairs in the showroom you may see the light in working order, and the factory at the present moment is lit with this light in conjunction with incandescent burners. You can convince yourself of the results obtained, and I shall be very pleased to answer any questions as regards the incandescent gas-light or this "Helios" gas-making machine which you may choose to put.

THE LONDON COUNTY COUNCIL SCHEMES IN PARLIAMENT.

UNDER their General Powers Bill, deposited by the County Council, power is sought to carry out street improvements in Cromwell Road and in Spitalfields; to acquire land in Clerkenwell for Fire Brigade purposes; to exchange land at the southern end of Peckham Rye for certain other land adjoining Peckham Rye Common; to purchase Fairseat House, Highgate, adjoining Waterlow Park, for the purpose of dedicating the same to the recreation and enjoyment of the public; to purchase Lincoln's Inn Fields Gardens; and to extend the time for the compulsory purchase of land for the purposes of the Blackwall Tunnel works. With regard to water supply, both the County Council and the Corporation of the City have deposited Bills providing for the appointment of a water committee, with power to promote schemes in Parliament for the acquisition, construction and maintenance of waterworks in order to afford a new or supplemental supply of water to the metropolis, to acquire or lease existing or future waterworks, providing for the dissolution and winding up of any water company, and for these purposes to raise further capital. Powers are also sought for making and enforcing regulations similar to those now issued by the existing water companies as to the character and material of all fittings and appliances, and to enable the County Council and the Corporation to hold public or private inquiries into the existing supply of water within the metropolitan area, together with the charges made for the same,

KALLKOLITH.
NEW PATENT PRIMING AND STAIN.
Acknowledged by experts of nearly every country to be one of the most important inventions of the Nineteenth Century.

KALLKOLITH is one of the most marvellous inventions of the present age, and is used as a priming in place of the now almost obsolete oil-colour. It produces an exquisite smoothness, combined with great durability, and amalgamates thoroughly with wood, iron, cement, stone, plastering, &c.

CHEAPNESS.—It saves at least 100 per cent. in comparison with any other priming now in use, being less than half the weight.

ECONOMY is manifested by the fact that one 14-lb. tin of **KALLKOLITH** goes further than three times the same quantity of oil-colour.

DRYING POWERS.—It dries within one to two hours, thereby greatly facilitating the quick dispatch of labour.

DURABILITY.—Where **KALLKOLITH** is used it imparts an amount of durability to all oil-colours used upon it which has never yet been obtained, and one of the most important advantages in its use is that the paint put upon it does not blister.

PAPER-HANGING.—Walls prepared with **KALLKOLITH**, thinned with seven parts of water, give a great additional advantage to the hanging of all descriptions of papers.

Price per case of 8 Tins of 14 lbs. each, net 40s., packing included. Special Terms to Wholesale Buyers and Shippers.

Address—KALLKOLITH CO., 175 STRAND, LONDON, W.C.

and into any possible future sources of supply. By another Bill it is sought to empower the London Financial Association, the Middlesex County Council, the Corporation of London, the London County Council, and the Hornsey, Tottenham and Wood Green Local Boards to purchase or lease the Alexandra Palace and grounds. While the County Council, in its Subways Bill, requires the several gas and water, telephone and electric light companies to make use of subways for the reception of all their mains, pipes and wires, the National Telephone Company ask to be allowed to erect additional overhead wires.

BOLTON TECHNICAL SCHOOL.

THE architects for the Bolton Technical School, Messrs. Bradshaw & Gass, have sent in the subjoined report to the committee :—

We herewith forward a complete statement of accounts of estimated expenditure to date. The amount expended on the buildings and fittings is 4,054*l.*, on machinery 4,003*l.* It is estimated that to complete a further sum of at least 700*l.* will be required, making a total of 8,757*l.* Subscriptions and donations amount to 7,950*l.*, of which 720*l.* is to be applied to clear off the liabilities on the buildings and 121*l.* expenses incurred in various ways, leaving 7,109*l.* available. This causes a deficit of 1,648*l.*, and a further sum of 800*l.* could with advantage be expended, mainly on tools and additional fittings. During the progress of the alterations it has been found necessary to undertake works which were not originally contemplated. These were caused by the buildings not being as sound as was expected (it being found desirable to strengthen the construction in many parts), by the bad state of the basement walls, drainage, roof and portions of the floors revealed during the progress of the buildings, and by additional work to the cotton-spinning and hosiery rooms, where much valuable machinery is being placed. The buildings are now in a perfectly good and satisfactory condition, stable in every part, and future repairs will be unnecessary. The recent experience at the Manchester Technical Schools, and the additional machinery presented and contracted for, made it desirable to increase the power for driving ; and to avoid supplementary engines being necessary, instead of two gas-engines 42 horse-power, three gas-engines 78 horse-power are being put in, and so arranged as to give greater economy in the use of gas for working under varying conditions. Wood-working and sloyd training departments have been increased, other portions of the building have been better adapted fo technical teaching purposes, and the general arrangements of the departments have been improved on first intention. These additional works, which were absolutely necessary, have inevitably entailed expenditure beyond that contemplated, but the greater portion has been expended on works which will reduce the annual outlay and give better facilities for teaching operations. An inspection of the building shows that every point has been carefully considered, and that in general working arrangements and appointments it is admirably adapted for technical teaching.

The extra works absolutely necessary are as follows :— Additional cost of enlarging cotton spinning-room and new skylights where rotten, &c., 200*l.* ; taking up floors in lecture-room and trussing beams and putting in new floors where floor rotted, and strengthening floor for hosiery and weaving, 190*l.* ; new gutters to roof and general repairs to same, 80*l.* ; extra cost of work in basement occasioned by ground being saturated with sewage-matter, 120*l.* ; putting damp-proof course round building and underpinning to foundations, 130*l.* ; foundations for gas engines and electric lighting, 150*l.* ; rebuilding wall on Bold Street side to give additional width in engineering department, 95*l.* ; extra weight of iron beams, pillars and tie-rods to strengthen building, new pillars, stones, &c., 100*l.* ; making good defective walls, 70*l.* ; total, 1,135*l.*

THE ROYAL HOSPITAL, KILMAINHAM.

A PARTY of members of the Royal Society of Antiquaries visited the Royal Hospital of Kilmainham, outside Dublin. They were courteously received by Lord Viscount Wolseley, K.P., Commander of the Forces, who is a Fellow of the Society. His lordship pointed out the objects of interest, principally armour, arranged in the great hall of the hospital. The charter of Charles II. was also shown. Lord Wolseley has caused the walls of the great hall to be decorated with trophies and armour, the great portion of which were removed from the Pigeon-house Fort. The chapel is being restored, so that the hall is now used as a temporary chapel. The party then visited the adjoining churchyard ("Bully's Acre"), and inspected the remains of the cross said to have been erected over the grave of Brian Boru's son, Murrough, who was killed at the battle of Clontarf A.D. 1014.

Kilmainham derives its name from St. Maighnenn, who was bishop and abbot there at the beginning of the seventh century. On the site of the earlier monastic establishment Strongbow founded, in 1174, a priory, under the invocation of St. John the Baptist, for the Knights Templars. This military order, which had been founded with the object of protecting pilgrims proceeding to the Holy City, gradually acquired extensive grants of land in many countries in Europe, together with extraordinary privileges and immunities. The dress of the Order was a white mantle, with a red cross over the left breast. Their banner, half black and half white, was called "Beauseant." Strongbow's grant of Kilmainham was confirmed by Henry II.; it became the principal house of the Templars in Ireland, and its prior had a seat in Parliament. The first prior was Hugh de Cloghull. The Priory was enriched by grants of land and advowsons of churches in various parts of Ireland. The vast possessions and enormous wealth of the Order, embracing in Europe, it is said, 10,500 manors, together with the privileges it enjoyed, made it a formidable power. Charges of idolatry and other heinous crimes were brought against the Templars in France in the beginning of 1307, and resulted in the Order being suppressed by the Pope, Clement V. Edward II. directed a mandate, dated December 20, 1307, to Sir John Wogan, the Justiciary of Ireland, to seize the persons, property and documents of all the Templars in Ireland on the Wednesday following the Feast of the Epiphany, and enjoined him to execute the order without delay, and before reports of what had been done in England could reach Ireland. In spite of the precautions taken the order was not effectively carried out, for by writ of September 28, 1309, the King directed the Justiciary to apprehend all Templars who had not yet been seized, and confine them in the Castle of Dublin. The last Grand Prior of the Temple in Ireland was Gerald Fitz Maurice, fourth son of Maurice, Lord of Kerry.

In 1312 Henry Tanet, late Master of the Templars, and other brethren who had been till then kept in custody, were brought to trial in St. Patrick's Cathedral, before commissioners appointed by the Pope, and being condemned, the Order was entirely suppressed and their possessions were transferred by the Pope to the Hospitallers or Knights of St. John of Jerusalem. The King confirmed the grant after protesting against the power of the Pope to make it.

The Knights of St. John of Jerusalem, also called Knights of Rhodes, and subsequently of Malta, from having their headquarters in those islands, were a military Order, somewhat similar to the Templars. Their habit was black, with a white cross of eight points on the left shoulder.

Several of the priors of Kilmainham filled the office of Lord Chancellor of Ireland, and Roger Utlagh filled the office of Viceroy from 1328 to 1331; as did William de Taney, 1372–73.

In 1408 a battle was fought with the Irish near Kilmainham, in which the Lord Lieutenant, Prince Thomas of Lancaster, afterwards Duke of Clarence, second son of King Henry IV., then in his nineteenth year, was severely wounded, and narrowly escaped being slain.

In 1413, Prior Thomas le Botiller, son of James, Earl of Ormonde, proceeded in command of a body of troops to the war in France, and took part in the siege of Rouen.

In 1444, Prior Thomas FitzGerald offered to support a charge of high treason against the Earl of Ormonde by single combat. Lists were prepared at Smithfield, in London, and a day appointed, but the King forbade the fight.

The famous Parliament held by Sir Edward Poynings at Drogheda enacted that whoever was made prior of this hospital by the Grand Master of Rhodes, or by his deputy, should be a man born in England.

Sir John Rawson, who became prior in 1511, at the dissolution of the monasteries in 1540 surrendered the priory and all its possessions to the Crown. He was granted a pension of 500 marks, and in 1541, as a compensation for the loss of his position as a spiritual peer, was created a temporal peer by the title of Viscount of Clontarf, which had been part of the possessions of the priory. After the accession of Queen Mary the priory was restored by Cardinal Pole, the Papal Legate, and Sir Oswald Massingberd appointed prior, and was the last prior of Kilmainham.

In 1680 King Charles II. directed the building of a hospital here for the maintenance of ancient and maimed officers and soldiers of the army in Ireland, near to the old building called the Castle of Kilmainham. The Royal Hospital was erected, after a design of Sir Christopher Wren, at an expense of 23,559*l.* It is a quadrangular building, two storeys high, enclosing an area of 210 feet. The north entrance, of the Corinthian order, is surmounted by a square tower, clock turret and octagonal spire. The dining-hall, 100 feet long, is wainscoted with oak, and contains portraits of most of the sovereigns and viceroys. The chapel has an ornamented ceiling, and the east window is the gift of Her Majesty. The Master is generally the Commander of the Forces in Ireland, who makes the hospital his official residence.

THE MANCHESTER INFIRMARY EXTENSION.

THE following letter on behalf of those trustees who are opposed to any extension on the Piccadilly site has been addressed to the Board of Management of the infirmary :—

December 10, 1891.

Dear Sir,—Referring to my letter of October 30 and the memorial addressed to your board by those trustees who are opposed to the extension of the infirmary at Piccadilly, I have respectfully to request you to bring under the consideration of your board the annexed suggestions for an extension of the infirmary at Stanley Grove or on some other site near to the Owens College. Those trustees who are opposed to any extension on the Piccadilly site feel that it would be extremely difficult, if not impossible, to make a successful appeal to the public for funds for any extension unless there is unanimity of action, and that with an opposing board, and the trustees divided into two sections, a deadlock would ensue, as the result of which nothing could be done either at Piccadilly or elsewhere. They therefore feel that it is extremely desirable that the consideration of the question of extension should be entered upon in a spirit of compromise, trusting to the experience of the future to evolve whatever further reforms may be found to be necessary. In drafting the annexed suggestions the following points have been carefully kept in view :—

(1) That the infirmary trustees would have to find a considerable sum to erect and maintain the hospital, and that their representatives would have the trouble and anxiety of administering its affairs. (2) That as the infirmary by its Act of Parliament exists for the benefit of "the sick poor," its funds can only be spent in the furtherance of this object. They can only be devoted to promoting the interests of the medical school in so far as these tend to further the interests of the patients. (3) There are, therefore, practical difficulties in the way of the infirmary taking any part in or being responsible for the proposed hospital, unless it becomes the property of the infirmary trustees and an integral part of the institution.

As a result of keeping these points well in view, the suggestions for an extension in Oxford Road make it a fundamental condition that both the extension and the existing infirmary shall be placed under one management, composed of the representatives of the infirmary trustees. I am to add that, as the result of considerable inquiry, my committee have reason to know that these suggestions would be regarded very favourably by many of those who desire to see that full and practical co-operation between the infirmary and the college which is so necessary for the efficacious treatment of "the sick poor" of the district, and for the perfecting of a great medical school in Manchester. They believe that the consideration of the suggestions would lead to a settlement of those questions which at present bar the way to so important and desirable a co-operation. My committee are of opinion that it is not only courteous to your board, but necessary for the proper consideration by them of any new plan of extension, that these suggestions should be placed before them.—I am, &c.,

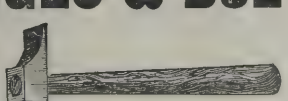
ANDREW A. GILLIES, hon. secretary to the Memorialists.

W. L. Saunder, Esq., secretary, Manchester Royal Infirmary.

Suggestions.

(*a*) That a hospital (to contain, say, 150 beds) should be erected at Stanley Grove, or elsewhere in the neighbourhood of the Owens College, on land transferred to the infirmary.

(*b*) The infirmary trustees to provide the funds to erect, equip and maintain such hospital. This would involve an expenditure of probably 50,000*l.* to 60,000*l.* and the necessary provision for maintenance. The friends of the college should unite with the infirmary board in an appeal to the public to provide these funds, more especially as a portion of the new buildings would probably be required for purely teaching purposes.



(*c*) The hospital should be the property of the infirmary trustees, and be managed by their board.

(*d*) A large proportion of the beds in the proposed hospital should be for the reception of medical cases, the beds at the infirmary being devoted mainly to surgical cases.

(*e*) Certain of the college professors should, *ex-officio*, be members of the infirmary staff, and have beds allotted to them at the new hospital and at the infirmary. Every member of the honorary staff would be subject to the rules of the infirmary board.

(*f*) The honorary staff of the infirmary should in future be elected by a committee consisting of members of the infirmary board, of representatives of the college, and of certain other representative men.

(*g*) There should be an increase in the number of the physicians and surgeons at the infirmary. The proposed extension would make this a necessity.

Price 2*s.*—Office, 175 Strand, London, W.C.

(*h*) There should be a revision of the present system of dividing the amount of the fees paid by the students to the members of the infirmary staff. A certain proportion of the fees should be paid to the infirmary board, especially as its proposed more intimate connect on with the school will imply additional expenditure.

(*i*) There might be one or more representatives of the college on the infirmary board and a similar number of representatives of the infirmary on the managing body of the medical school.

(*k*) The teaching of the infirmary should be correlated with that at the college.

TRADE RULES.

THE following are the working rules and regulations for the house carpenters and joiners of Edinburgh and Leith approved of by a Board of Conciliation, consisting of seven employers and seven operatives :—1. For competent workmen the standard rate of wages to be 7½*d.* per hour, and to be paid weekly. 2. The regular working hours to be 51 per week—*i.e.* 9 hours per day for five days, and 6 hours on Saturdays, except as after provided for. Work to begin at 6, 6.30, or 7 A.M., and to cease at 5 P.M., and 1 P.M. on Saturdays. During winter months the hours to be as follows, viz.:—From November 4 to November 18, 8½ hours, Saturdays 5 hours ; from November 18 to December 2, 8 hours, Saturdays 5 hours ; from December 2 to January 6, 7½ hours, Saturdays 5 hours ; from January 6 to January 20, 8 hours, Saturdays 5 hours ; from January 20 to February 10, 8½ hours, Saturdays 5 hours. All time in addition to the foregoing to be paid for at the rate of time and quarter up to 10 o'clock P.M., and after that hour double rate of pay to be allowed; but these extra rates are only to take effect after a week's work has been wrought, except in the case of men taken on during the week. Wages to be paid at the regular time of ceasing work, or sufficient time allowed to travel to workshop for these. 3. Within the municipal boundaries of Edinburgh and Leith, men to reach their work and travel from the same in their own time. If not over four miles beyond the boundaries, 6*d.* per day to be allowed, or travelling time to and from these ; but if over four miles, to be allowed 4*s.* per week, and railway fares when sent to and from the job. When men are taken on for or at a country job, this rule does not apply. 4. After 30 hours' work with an employer, men to be allowed one hour to put their tools in order ; and after 51 hours, two hours for that purpose. 5. Employers to provide means for workmen warming their meals at outside jobs and in workshops, and to find some one to attend to the same. Also to make provision for the safety of tools. 6. No piece or task work to be wrought by workmen, and no sub-letting unless sub-contractor supplies plant and material. No materials to be carried for employer, except in working hours. The above rules and regulations to come into force on the first day of January 1892.

WATER POWER IN FLEET STREET.

THE *Daily News* gives the following account of an interview with Mr. Ellington concerning the high-pressure system at work under London streets :—

A new eruption in Fleet Street, though not so serious as when last the pavement was up. Ludgate Hill is likely to follow suit, and sooner or later Chancery Lane, Bridge Street, Farringdon Street, wherever loads of passengers or of goods have to be raised cheaply and expeditiously. The hydraulic engineers are at work developing Bramah's invention, just as the electrical engineers are developing Faraday's. In Fleet Street they are putting their "mains" down for the first time. By "they" I mean Messrs. Ellington & Woodall, of Palace Chambers, Westminster. These gentlemen have burrowed their way through fifty-three miles of the soil of London in about half-a-dozen years.

"Not easy work always, Mr. Ellington?"

"No ; we have to feel our way about gas-pipes, sewage mains, water-pipes, telephonic mains, electric mains and so forth. At a certain spot in the City we were brought to a dead stop, so that we had to turn about and make a detour by one or two streets. Underground London is in some parts so closely packed that further excavation is impossible. 'Subways?' Yes, with subways this inconvenience might be avoided ; but, as a matter of fact, the cost of constructing subways would be so enormous that we must regard them as impracticable."

Underground London's network of sewer-drains, water-pipes, gas-pipes, hydraulic pipes, &c., spread through a hundred and twenty square miles or so of soil, must be about as intricate as the arteries and veins of the human body.

"Here is the map of our operations. The red lines along the streets indicate our fifty-three miles of mains. In 1887 we

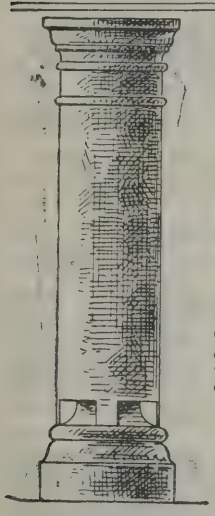
had only twenty-five miles. You see our system extends from near the West India Docks to Hyde Park Corner in one direction, and in the other from Mint Street, south of the river, to some distance beyond Old Street, north of it. But we shall soon push on beyond the Old Street limit, and we are to have a new pumping-station near it, from which station hydraulic power will be available for houses and places of business over a large and new area of northern London."

And now a word or two about the pumping under Ellington & Woodall's high-pressure system. Everybody knows in a general way what hydraulic power means. But very few know how it is manufactured on the Thames. I must condense his account of it, just as I have in the foregoing paragraphs summarised his conversation—apprising the reader that if there are any mistakes they are mine and not Mr. Ellington's. Here, then, is the principal fact—the pressure produced at one of the London Hydraulic Power Company's pumping stations is as great as it would be if the accumulators, or tanks, instead of being subjected to steam-power close to the earth's surface, were elevated 1,700 feet above the pavement of London streets, and left to exercise their pressure downwards from that height. Suppose there was a waterfall 1,700 feet high—five times the height of St. Paul's—at Southwark Bridge pumping-station; if the falling water came through a pipe with, suppose, its bottom end turned up like the tail of the letter "t," it would spurt up to a considerable distance, because of its tendency to recover its level. The hydraulic lift on which the reader is carried to the upper floors of his club, or place of business, or residential "barracks," is, mechanically-speaking, pushed up by a spurt of the above description. But as there are no reservoirs at a height of 1,700 feet to produce "pressure headway" in the hydraulic pipes that are laid down beneath the pavements, the necessary pressure is produced by powerful pumps—the pressure in the accumulators amounts to 750 pounds upon every square inch. I must not burden Mr. Ellington with the responsibility for the illustration of a T-shaped tube five times the height of St. Paul's; the illustration is mine.



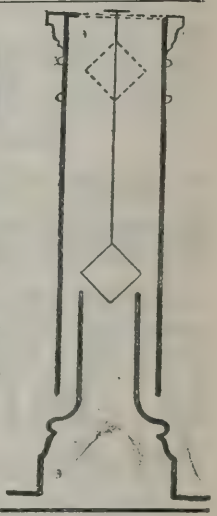
"We have three pumping-stations," Mr. Ellington told me, "one at Falcon Wharf, a short distance to the east of Blackfriars Bridge; another at Millbank, Westminster; a third at Wapping; and we shall have a fourth in the City Road, at the spot I have already mentioned. All the water we use is taken from the river, but it is most carefully filtered before it is passed on into the mains." The word mains means main pipes. From the street hydraulic main pipes are led off to houses and places of business, just as gas and water pipes and electric wires are. "What happened," Mr. Ellington resumed, "when you came up to this floor of Palace Chambers by the hydraulic lift? The attendant turned a cock; that permitted the rise of the water in the hydraulic pipe, and with the thin column of water the lift rose. When the attendant wanted to lower his lift he simply turned another cock, which allowed the water to escape as waste into the sewers. As the water escaped the lift descended."

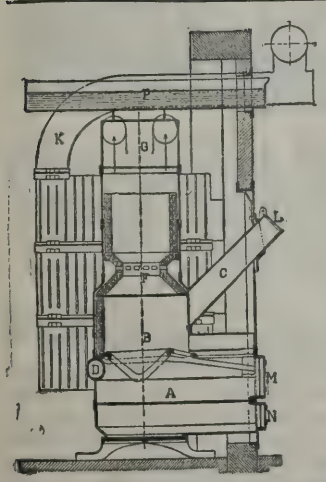
"That lift by which you have come up is only one of 1,470 which our company have already at work in London. You will notice that they are more densely distributed over the City than elsewhere. The reason is that hydraulic lifting-power is particularly suitable for commercial places. Steam-power, condensed air and electric-power are particularly well fitted for lifting weights in manufacturing localities; but, as I have said, for warehouses, offices, commercial quarters, as distinguished from factories, for residential chambers, hotels, clubs, the best lifting-power is hydraulic-power. It is the safest, simplest, cheapest, best plan of lifting weights. In this kind of work hydraulic engineering need fear no rivalry whatever."

"I wish," I said, "you would invade the platforms of the District and Metropolitan Railways. Gower Street Station, for example, and Portland Road Station, Westminster, Farringdon and the rest, where you have to rush up and down long flights of narrow and more or less tortuous and slippery stairs."

"There certainly is room there for hydraulic carriage," Mr. Ellington admitted. "You know that on the electric railway from the City to the Surrey side passengers are lowered from the street to the trains and raised from the trains to the street by hydraulic platforms. The same arrangement is to be carried out on the new electric railway which is going to be constructed. And there is another and extremely important use to which hydraulic power may be turned for the public good. I mean its use for fire-hydrants. That was Captain Shaw's strongly-expressed opinion. You can imagine how easily a jet of water with a pressure of 1,700 feet could squirt over a building 100 feet high. I am surprised the County Council have not taken the matter up."

It is well worth recording that the old house at the Blackfriars pumping-station is believed to have been occupied by Sir Christopher Wren during the building of St. Paul's Cathedral. In the West-end of London one of the most remarkable developments of hydraulic engineering is the growing use of lifts in





THE
"CLIMAX" VENTILATING CO.'S
DIRECT ACTING
CHIMNEY COWL,
For the Preventing a Blow-down.

This Cowl is specially designed for preventing a blow-down and assisting the up-draught. It is admittedly the most efficient in the market. Its construction is scientifically and mathematically correct, and no matter from what direction the wind strikes it, a powerful upward current is established. It is noiseless, has no movable parts to get out of order, is easily cleaned, the cone over inner shaft being made to push up. It has THE very decided advantage over every other Cowl, IT IS SIGHTLY.

private houses, as on the Kensington estate. Anybody, the merest child, can control these lifts. "The doors opening to the lift cannot be opened until the car is at rest at the door to be opened, and the lift cannot be worked until the doors are closed."

NEW RAADZAAL, BLOEMFONTEIN.

OUT of fifty designs submitted in competition for this building in 1883, those prepared by Mr. Lennox Canning (Lennox, Canning & Goad), of Johannesburg, were selected. Eventually the building was commenced in April 1890, though, owing to reasons of economy, if not of parsimony, portions of the design were abandoned, the late T. R. Robertson, of Johannesburg, being the contractor. According to the architect's description, the Raadzaal is approached by a circular lobby under the dome and access to two side lobbies is obtained therefrom. Two stone spiral staircases lead to the gallery and rooms contiguous thereto. A lofty and spacious grand portico approached by a flight of stone steps faces the lobby of the House, and two semi-circular porticos of smaller size flank the other entrance doors, whilst a wide colonnade spans the entire distance from the west eastward so far as the office buildings. These porticos and colonnades are supported by stone columns (about 24 feet high and 2 feet 3 inches in diameter at the base), on which will rest the stone cornice, frieze, architrave and balustrade. Surmounting the main walls of the central lobby the dome is to be built, and is now in a forward state. This part of the superstructure is entirely of stone, designed with eight semi-arched openings. The dome is covered with pressed zinc tiles resembling the scales of a fish, the ribs or intersections being of boldly-designed rope-pattern in malleable zinc. Above the dome rises a graceful lantern, covered also with zinc plates and scales, the whole being finished by a figure grasping a flag-staff in the right hand. This figure is a beautiful example of zinc modelling, and is the work of a well-known Dutch artificer, Mr. Braat, of Delft.

Having in view the clumsy work executed in South Africa generally (not from want of skill, but want of machinery), the gutters and other zinc-work have been made in Europe.

The design is Greek in proportion and detail, but the addition of the dome and arched openings lend a Græco-Roman feeling to the ensemble. Great care has been taken that the proportion of the mouldings and other details shall be in accordance with the best traditions, and it may be noted that the cast for the caps to the columns has been modelled from an example taken from the ancient temple dedicated to Jupiter Olympus, now in the Greek Gallery at the British Museum.

As to the interior of the Raadzaal, the ceiling consists of a broad cove all round, the centre portion being slightly arched; over the deputies' seats, or the table of the House, an elliptical cupola is placed, for additional light and ventilation. The entire ceiling is boldly panelled, and enriched ribs spring from the pilasters against the flank walls; the panels are heavily moulded, and relieved with egg-and-tongue enrichments. At the springing of the cove is a bold cornice frieze and architrave with enriched dentils and foliated pateras. The ceiling and cornice is of fibrous plaster, a beautiful material capable of almost any development.

The pilasters supporting the entablature (or cornice) are of fibrous plaster, having fluted shafts, moulded bases and foliated caps, the latter after a celebrated example. The gallery front and ceiling is of plaster, supported by bold and richly-ornamented consoles. It is not intended for the use of the general public, but may be used as a musicians' gallery, or placed at the disposal of distinguished visitors. The entrances to the chamber are nine in all, an ample number for a room which would accommodate, if all the space was occupied, allowing 8 feet superficial to each unit, 622 persons. There are three entrances from the lobby. The central lobby under the dome has a plaster domed panelled and moulded ceiling, with a top light of stained-glass, and an enriched cornice; the side lobbies have groined, panelled and moulded ceilings, with enriched cornices round. The paving to the lobbies is of Devonshire marble. The walls of the lobbies and Raadzaal are to be plastered in the finest Parian cement, a perfectly pure white substance of fine texture and hardness, and this portion of the work will be painted in stippled colours throughout. The question of the use of cements in a dessicated climate is a vexed one. Portland cement does not lend itself to fine internal work; local lime burnt by rude methods is next to useless; daggar is on many counts detestable. Many experiments have been tried with the fine cements, such as Robinson's, Keene's and Parian, for durable work, and the result shows that a ground coat of good Portland finished with any of the fine white cements above-named is the very best formula for work of this class in dry climates.

The floor of the Raadzaal will be of light Stettin oak, polished on the surface. This work is made in England, and is framed in sections of about 6 feet square of well seasoned oak, pre-

WOOLPITS, SURREY. FOR SIR HENRY DOULTON BY ERNEST GEORGE AND PETO.
PROOFS of this Illustration, which appeared in "The Architect" on June 6, 1885 (now out of print), can be obtained on application to the Publisher, price Sixpence each; post free, on roller, Ninepence.
P. A. GILBERT WOOD, 175 Strand, London.

pared to be ready for laying on arrival direct to the under timbers. The whole of this work had been completed when a fire occurred at the manufactory, and the whole was destroyed. The loss, however, was covered by an ample insurance. The corridors as well as the colonnades, anterooms and porticos, are to be laid with encaustic tiles. All the wall-papers have been specially printed by Messrs. Jeffreys, of Essex Road, Islington, London.

The Raadzaal is to be heated with hot-water radiators from a special apparatus provided for the purpose, capable of supplying a maximum heat of 60 deg. upon the external register.

Special care has been exercised in providing sufficient ventilation for the Raadzaal, smoking-room, &c., upon the improved principle of automatic exhaust air-pumps. The external windows are all to be fitted with plate-glass except those in the Raadzaal, which are of painted cathedral glass emblazoned with the arms of the State.

Ample sanitary offices are to be erected at the east end of the site upon a—for here—improved principle. The site is to be enclosed with a dwarf stone wall and an ornamental iron railing. At the entrance carriage gates will be arranged a side gate for pedestrians. There will be a lodge attached thereto of simple design.

Unfortunately the levels of the site are contrary to good effect, but a terrace is to be made all round the building, 30 feet on each side, perfectly level, gravelled up to the lowest step leading to the porticos.

The whole of the movable furniture, mantelpieces, overmantels and over-doors will be manufactured from special designs prepared by the architect to harmonise with the design of the building.

The interior of the Raadzaal is now in an advanced state, and it is hoped that the structure will be ready for occupation for the sitting of the Assembly in May 1892.

Especial care has been taken with the importations. The firms who supplied goods are :—Messrs. Hill & Son, 100 Queen Victoria Street, locks and ironmongery ; Messrs. Walter Macfarlane & Co., of Glasgow, castings ; Messrs. Braby & Co., Euston Road, Mr. Braat, of Delft, Holland, and Messrs. Holden & Co., 5 Wood Street, Westminster, zincwork ; The Plastic Decoration Company, 21 Wellington Street, Strand, fibrous plaster ; Messrs. Hindley & Co., Oxford Street, parquet flooring ; Mr. Edwin Horwood, Frome, painted glass ; Messrs. J. & E. Goad, Plymouth, marble paving ; Mr. Curtis, Shepherd's Bush, marble mosaic pavement ; Messrs. Cohen & Co., Curtain Road, London, mantelpieces ; Messrs. Kite & Co., Chalton Street, ventilators ; Messrs. Woolliscroft & Sons, Hanley, Staffs., encaustic tiling ; Messrs. Jeffreys & Co., Essex Road, Islington, wall-papers ; Messrs. Cafferata & Co., Carlisle, Parian cement ; Messrs. Macdonald, Aberdeen, polished granite steps ; Messrs. Edgcumbe, Rendle & Co., Westminster, cupola lights, and Messrs. Rosser & Russell, Charing Cross, the heating apparatus. Nearly all the goods above enumerated are now delivered upon the site ready for fixing *in situ*.

The late contractor, Mr. Thomas R. Robertson, executed the work during the tenure of the contract in a perfectly satisfactory manner, as also Messrs. Heimann, who since assumed control of the works.

Mr. Collingwood Tully is officer in charge, and much of the present progress of the work is due to his untiring efforts. Mr. A. Wocke, clerk of works, has rendered valuable assistance from the first.

DILAPIDATION IN AN ARCHITECT'S HOUSE.

IN the Queen's Bench Division of the Irish Court, Mr. J. L. Robinson, architect, sued Dr. Edward Kennedy, the Collector-General of Rates, in respect of alleged dilapidation of a house at Cultra, Glenageary. The plaintiff sought to recover 60*l.* 19*s.* 6*d.* in respect of alleged breach of contract to keep in good order and repair the house known as Cultra, Glenageary, held by the defendant from the plaintiff. The plaintiff stated that the defendant in April 1886 became tenant of the house and premises known as Cultra, Glenageary, for three years, at a yearly rent of 145*l.*, from June 1, 1886, on the terms that the defendant should keep the house in good order and condition, and deliver it up in good repair at the end of the term, and that the defendant did not carry out the terms of this agreement. Mr. Robinson was examined, and deposed to dilapidations which he alleged were made in the house. The defendant denied the dilapidations, and said he delivered up the house in the same condition as that in which it had been when he got it, allowing for reasonable wear and tear. Lest he should be under any liability to the plaintiff, the defendant brought 10*l.* into court as sufficient to satisfy the plaintiff's claim in respect of the matters alleged.

Mr. Long, builder, gave evidence that the injuries were not caused by reasonable wear and tear.

The defendant said he called Mr. Robinson's attention to defects in the plastering in the house. He also stated that the

bedding of the tiles was imperfect. He went through the other items, and denied that any injuries had been done, except what arose from reasonable use of the premises.

Mr. Murray, architect and engineer, stated that there was no injury to the housework of the house.

The jury found for the plaintiff for 2*l.* 10*s.* over the 10*l.* lodged in court.

THE ONCKEN STAVELESS BARRELS.

THERE is now on exhibition at 48 Queen Victoria Street, E.C., some specimens of the Oncken staveless barrels, which have been inspected and approved by large numbers of parties interested in the subject, and a limited company is about to be launched for taking over the concern and working it on a very large scale. The Oncken machine unrolls, so to speak, the logs of poplar, oak, elm or other wood treated by it, by reducing the same to one long strip or veneer of the requisite thickness. The sheet of wood so obtained is then cut into suitable lengths for making such barrels as may be required. By a second process, the sheets of wood are cut at the extremities into a number of grooves, so that they can be bent into barrel form. Some other manipulation takes place, and then the barrels are ready to have the hoops driven on, after which the process is completed, and there is presented a finished article which answers the purpose admirably, at a cost which, it is claimed, must be considerably less than by any other process hitherto employed.

JARMAN'S ELECTRIC MOTOR.

A SATISFACTORY trial was recently made of a tramcar propelled by Mr. Alfred Jarman's electric motor on the Croydon Tramways, in the presence of Major-General Hutchinson and Major Cardew, the Board of Trade inspectors, and a number of local notabilities. The motor is low-speed (650 a minute), and capable under ordinary circumstances of running at the rate of eight miles an hour, which could, however, be doubled, if necessary. The car is fitted with two of these motors, which are of 7 horse-power nominal each, but the pressure can be increased to 14 horse-power with safety, it is claimed. The cells are placed under the seats, and it is claimed that the car can be run thirty miles with one charging. It is lighted by four lamps of 16 candle-power each, which derive their energy from the same source as the motor. The Electric Tramcar Syndicate are said to be under a contract with the Croydon Tramways Company to run these cars in Croydon, and a commencement is expected to be made in the course of another fortnight. The result will be watched with interest.

BEDDINGTON PARK ESTATE, MITCHAM.

IT is a matter of surprise and wonderment that the general body of investors should be so disinclined or hesistant in the matter of purchasing land, considering that property of this character may usually be regarded as absolutely secure, with the contingency generally of increasing in value, for although riches, we are told on good authority, certainly take unto themselves wings, as many have experienced, yet land is so entirely dissociated from anything of a portable character, that it may be regarded as one of the most permanent possessions existing in this sublunary sphere. Complaints are rife that the land is held for the most part by a privileged few, but there is no reason why the number of small landowners in this country should not be increased to an almost indefinite extent, for all the facilities, along with inducements for so doing advantageously, are to be found by diligent search ; but it seems that things which are a long way off have more attraction for the majority of people, who are apt to put their money in concerns that are speculative and more or less shadowy, with the result too often that experience of a costly kind is gained.

London, with its immense and ever-increasing population, has still much need, vast as it is, to spread itself out more and more ; fortunately opportunity for so doing is still afforded, owing to the vacant areas of land to be found within a reasonable distance of the City, and it is on the southside particularly that this relief for a congested population is tobe obtained, for not only does great natural beauty and fertility attach to the county of Surrey, as well as other advantages, but the means of communication are rapid, thanks to the network of railways existing and the quick service of trains.

In connection with this subject, which is one of perennial interest to architects and builders and the public generally, we had the opportunity a few days ago of inspecting a little estate of about twenty acres between, and within a short walking distance of, Hackbridge and Mitcham Junction stations, which latter can be reached by train from either Victoria or London Bridge in

about twenty minutes. The property referred to is on the high road to Carshalton and Sutton (which are adjacent), and onward to Epsom and Leatherhead. Wallington also is near to, while the large and important borough of Croydon is accessible in a few minutes. The river Wandle—or stream rather—is in close vicinity, and the surrounding scenery is of a pleasant character, while the air is pure and health-giving. The estate is laid out in a number of well-arranged roads, properly and soundly constructed. Evidently it is well-adapted for building purposes, as the subsoil is gravel, with a rich loam on the surface, rendering it adaptable also for garden cultivation. The whole has been well drained, under the supervision of the Surveyor to the Rural Sanitary Board, who also superintended the construction of the roadways. The sewage system appears to be faultless, the outfall being into the main drain below the highway facing the property. Water is also laid on by the Sutton District Water Company, who furnish an abundant supply as and when required, so that those who purchase plots incur no outlay in respect of either sewage or water, which is an important consideration. There is likewise said to be a great demand for houses and cottages in the neighbourhood, several of which have already been built on the estate, and we are informed that quite a number of purchasers of plots have signified their intention to build in the early part of the new year.

It may be added that the prices of the plots, which are free of tithes and land-tax, range from as low as 25*l.* upwards, and there is no charge for conveyance, while the terms of payment are extremely easy, for only 5 per cent. of the purchase-money is required by way of deposit, and the balance is spread over three, five or ten years, no interest being charged the first year, but afterwards 5 per cent. on the unpaid balances. Possession of the land can be had immediately, and there are no vexatious restrictions, nor is building made compulsory. It is significant that the owner of the estate, Mr. Walter Allnutt, lives there, and it is noteworthy that he expresses his readiness to render purchasers of plots every assistance in building a house, although they can choose their own plan and builder if they so elect. All that is stipulated for is a small deposit, proportionate to the cost of both land and proposed house, then the matter is carried through speedily, without further money being required until completion of the building, so that any member of a building society can get a house erected cheaply to his taste, and those who are not actually such members may readily from the same source obtain the requisite means to pay for the house when finished.

It will thus be seen that the acquisition of a plot of land, with a house built thereon if needed, in a rural locality is within the reach of even those who have but slender means, while the tendency of living a few miles out of, rather than in London, is deserving of encouragement on both moral and hygienic grounds.

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.*]

APPLICATIONS FOR PATENTS.

20806. Arthur Illidge, for "Improvements in or relating to sash fasteners."

20821. Henry Thomas Johnson, for "Improvements in valve ventilators."

20822. William Bracewell, for "Improvements in means or appliances for ventilating and supplying moistened air in weaving and spinning factories and other enclosures."

20834. Loftus Balfour Moreton, William Oakley and John Stokes, for "Improvements in padlocks and other locks."

20894. Henry Bernouilli Barlow, for "An improved nut lock."

20921. William Browne Parker, for "Improvements in safety hooks for the cages of lifts and hoists and for other purposes."

20973. Owen Willmer White and James Painter Williams, for "Improvements in fastenings for doors, gates and the like."

21004. Henry Humphries Cribb, for "An improved mode of preparing, fitting and laying blocks for floors, walls, or ceilings of wood or other material."

21024. William Wright, for "An improved method for hanging window sashes."

21085. Arthur Patschke and Wilhelm Eichner, for "Improvements in mounting and arranging drawing-boards and in appliances in connection therewith."

A PARSEE FIRE TEMPLE.

THE Bombay papers contain accounts of the consecration there recently of a new temple erected for the reinstatement of the sacred Adaran fire. The fire was installed in 1733 by Manockjee Nowrojee Shett. The old building showing signs of decay it was replaced by a new one at a cost of about a lac of rupees by Mr. Jalbhoy Ardeseer, the eighth lineal descendant of the founder. It is built in the ancient Persian style of architecture. A flame, before it falls into one of the three recognised classes of Parsee sacred fires in India, has to undergo certain ceremonials corresponding to the dignity of the order to which it is destined to belong. Thus, only a thirtieth part roughly of the expenditure and religious recitation would be required to consecrate a Dadgan fire than when a Beheram fire is intended to be installed. The most ancient fire at present in India is at the secluded village of Oodwada, near Bulsar, and the Parsees make it a point to repair to the Beheram fire there in large numbers during the months which are specially allotted to the presiding genius of fire. It was consecrated about twelve centuries ago by the ancestors of the present Parsees in commemoration of the voyage they had in their emigration from Persia to India. The priests vowed to institute the fire in the event of their ships landing them in safety on Indian soil. The fire is fed, at five stated times during each twenty-four hours, with sandal-wood, benzoine and quantities of other odorous materials, as well as with very dry fuel. This, however, cannot be done without previous compliance with certain religious formulas. Next in rank to the Beheram fire is the Adaran, the one reinstated recently in Bombay. It is placed in a large silver censer, estimated to have cost about 7,000 rupees. The hall in which it is placed could not be entered except by the officiating priest or his immediate assistant. While the building was under construction the Adaran fire was removed to a place set apart for the purpose and for the use of the priests in charge. All the arrangements for the removal and reinstatement to the new temple were made under the directions of the hereditary priest officiating in the temple. After the ceremony was over, one of the priests read, on behalf of the priestly community making use of the fire-temple, an address of congratulation to Mr. Jalbhoy Ardeseer, and presented him with a flower vase as a memento of the occasion. The majority of the Parsees then adjourned to partake of the "chasnee," which meant the tasting of sacred wine, fruit, milk and such other edibles over which prayers had been recited.

"SPHINX" PORTLAND CEMENT

112 lbs. per bushel. Slow setting; test 1,000 lbs. to 1¼ inch; seven days. Fineness, 2,500 meshes to square inch, with less than 10 per cent. residue. Over 10,000 tons supplied to Cardiff and Hereford Water Works.

Specially adapted for Concrete Floors and Street Paving.

"ECLIPSE" PORTLAND CEMENT

Quick setting; test, 3 parts. Standard Testing Sand, 230 lbs. per square inch; 28 days. The finest, most plastic, best sand carrying, and cheapest Cement in the market. Specially adapted for laying encaustic tiles, making joints in sanitary pipes, internal stucco, concrete foundations, &c.

ANCASTER NEAR GRANTHAM

CUTTING TOOLS.

AT the last monthly meeting of the Leeds Association of Engineers, Mr. J. C. Moorhouse read a paper on "Cutting Tools." Treating first of the material used for cutting tools, he carefully described the process of production of suitable steel, showing how the varied percentages of carbon materially affected the quality of tool steel. He also classified the qualities for various purposes. A steel containing 1½ per cent. of carbon was suitable for turning and planing, and also for drills; one with 1¼ per cent. of carbon for turning, slotting and planing, and small cutters; with 1⅛ per cent. of carbon for milling cutters, mill picks, taps, rimers, &c.; with 1 per cent. for cold chisels and shear blades; with ⅞ per cent. for forging dies, swages and fullers; and with ¾ per cent. of carbon for hammers, snaps, miners' drills, &c. There was also a steel specially produced for taps with a soft core. In the manufacture of the various tools, the smith must be carefully overlooked. It must be seen that the steel is not overheated, and care must also be taken when annealing or hardening was going on. The self-hardening steels were dealt with, and the palm for this material awarded to Messrs. Osborn & Sons, their steel bearing the name, and being manufactured under the supervision of Mr. Mushett. Other makers, however, press them very closely indeed. Mr. Moorhouse strongly advocated that all cutting tools should be ground by one man to the best recognised forms and angles, instead of their being ground by each man as he liked, the tools to be then placed in store and issued to the workmen as required. He also advised the speed of grindstones to 1,000 feet per minute. The paper was well received by the numerous auditors, and the Chairman at once commenced a discussion upon it. Mr. A. Rixson (Messrs. Woodhouse & Rixson) described at length the storage and distribution system at Messrs. Ruston, Procter & Co., Lincoln, which is on similar lines to those proposed by Mr. Moorhouse. With regard to Mushett steel, he said that there are two Mr. Mushetts, and they arrange for one of them to be present during the manufacture of their steel, which can be softened by using powdered carbon, and again restored by heating to a blood red and exposing to a cold blast. He recommended careful forging, saying the steelmaker has two enemies—one imaginary, called phosphorus, and one real, called a smith. He advised that each class of steel should be got from one man, say Mushett's for castings and rough turning, Howell's special for roughing forgings with large cuts, Hunsman's for taps, and so on. Mr. Alfred Atkinson thought the percentages of carbon named by Mr. Moorhouse were rather high. He recommended tools of heavy section, and thought the store system of distribution must pay in the long run. Mr. Lupton thought the store system did not give an apprentice an opportunity to learn how cutting tools should be ground. Mr. Thornton said he had found classifying and storing tools to answer satisfactorily. Mr. Yates objected to grindstones running at 1,000 feet per minute. Mr. Moorhouse, in his reply, thought that apprentices accustomed to correctly-ground tools would the better know how to grind them.

SILVER AND ELECTRO PLATE.

IT is an advantage for the heads of public institutions, and householders in general, to be able to obtain silver and electro-plate which will be of superior quality and of designs that will sustain scrutiny. The need has been met by Messrs. Williams & Co., of Newhall Street, Birmingham. As they are manufacturers of standing, they have advantages which are not possessed by many in the trade who have to depend on firms that are not well established for their goods. In style Messrs. Williams & Co.'s work has many advantages from the character of the designs. The articles are not likely to be affected by changes of fashion.

BUILDING AND BUILDERS.

AT the meeting of the Middlesex County Council, on the recommendation of the Finance Committee, it was agreed to carry out certain new works in the Council Chamber and Sessions House at the Guildhall, Westminster, and plans were adopted. The estimated cost is put down at 20,000*l*., and the Finance Committee were instructed to obtain tenders for the work.

IT has been decided to proceed at once with the erection of a new mission church, to be called St. Philip's, in connection with Christ Church, West Bromwich, upon a site in Beeches Road, the land having been presented for the purpose.

THE restoration of Sandringham House has been pushed rapidly forward. A new fireproof floor, measuring 60 feet by 40 feet, having iron girders and patent blocks, with 6 inches of concrete above, has been constructed in place of a similar one on the second floor damaged by the recent fire. The injured walls have been taken down and rebuilt of cement, while the

windows have been restored with plate-glass. The fireproof floor has been constructed by Messrs. Homan & Rogers, London and Manchester.

THE contract for the Blackpool Tower has been placed in the hands of Messrs. Heenan & Froude, of Newton Heath. The erection is intended to be of steel. The height is to be 500 feet. The weight of metal will be 1,500 tons, and the contractor undertakes to complete the erection by Easter, 1893. Messrs. Neill, of Manchester, are at present engaged in pulling down the old buildings, and the excavation for the foundations will commence next week. These will be of a very massive character, each of the four foundations consisting of a solid block of Portland cement concrete, 44 feet square and 12 feet thick, with steel beams crossing and recrossing, and ponderous steel bolts, by which the foundation-plates of the tower will be anchored down to the concrete below, which rests upon a thick bed of solid boulder clay. There will be no stone intervening between the concrete and the bed-plate of the tower; but this plate will be embedded directly in the concrete, and the interior of the tower legs will be filled up for several feet with a solid mass of concrete lying above the bed-plate. In addition to this, each of the four legs of the tower—20 feet square—will be clothed with 18-inch concrete walls for a distance of 100 feet, where they will emerge above the roofs of the surrounding buildings.

AT the meeting of the Edinburgh Dean of Guild Court warrant was granted to Mr. W. Hamilton Beattie to make alterations on the Clarendon Hotel, Princes' Street, with a view to the introduction of a lift, the widening of the entrance, the connecting of the east gallery of the Princes' Street Arcade with the hotel, and other improvements.

ALL SAINTS' CHURCH, Hertford, was completely destroyed by fire on Monday, the 21st inst. The fire was discovered at five o'clock, and it then had such a hold upon the building that there was no chance of subduing it. A valuable organ and several memorial-windows were destroyed. The only things saved from the fire were the old registers. Last Sunday week the church was broken into by burglars. The building is partially insured.

THE flannel-mill of Mr. Alfred Tattersall, at Wardle, near Rochdale, has been destroyed by fire, and damage to the extent of about 500*l.* was done to the premises of Mr. James Stott adjoining. The damage in Mr. Tattersall's case is estimated at from 8,000*l.* to 10,000*l.*

RATTON HALL, near Eastbourne, belonging to Mr. Freeman Thomas, has been destroyed by fire. Excepting the valuable contents the loss has been small, the house having no architectural interest, and its rebuilding had been proposed.

A FIRE has occurred on the premises of Messrs. Pollard & Heys, Gateside Printing Works, Barrhead, Glasgow, and resulted in damage to the extent of about 8,000*l.*

THE main building of the Church of England Training College at Carnarvon has been destroyed by fire.

THE Gilesgate Infant Board School, Durham, is about to be enlarged for the Durham School Board, from designs by Mr. H. T. Gradon, A.R.I.B.A., Architect, Durham.

TRADE NOTES.

THE Town Council of Alloa have entrusted the ventilating and heating of the municipal buildings to Messrs. Baird, Thompson & Co., ventilating and heating engineers, London and Glasgow. The County Council have also instructed this firm to examine and report upon the heating of the county buildings and prepare plans.

THE Barrow-in-Furness Board-schools are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Mr. E. H. Shorland, of Manchester.

MR. W. H. RADFORD, C.E., of Nottingham, has been instructed by the Corporation of Durban to advertise for tenders for the supply of electricity to the inhabitants of Durban, and for the lighting of the public streets. The population is about 24,000 and there are no gasworks.

MESSRS. GOODMAN, HUGHES & CO. had a sale last week at their new auction mart, 44 Bishopsgate Street Without, of deals, battens, boards, mouldings and other wood goods. There was a fair attendance of buyers, we understand, and a good number of lots were disposed of at prices that were considered fairly satisfactory. It is expected that another sale will be conducted by the same firm in the early part of the new year.

A PULPIT has been placed in the church of St. John the Evangelist, Stand, near Manchester, as a memorial of the late vicar, the Rev. W. D. Carter, M.A. The pulpit is of veined alabaster, with a base of Hopton Wood stone. Around the

pulpit are three niches with green marble shafts. Two of the niches contain tracery, and the centre one holds the figure of St. John accompanied by his eagle, carved in white alabaster. The work has been carried out by Messrs. Earp & Hobbs, from drawings by and under the direction of Mr. J. Medland Taylor, the architect of the church.

A VERY handsome memorial brass, designed to suit the architectural features of the justly celebrated Norman church at Melbourne, near Derby, has just been erected in the "Cantrell" chapel, to the memory of the last bearer of that name who was buried in the cemetery at Melbourne. The distinctive feature of the design is a large copper cross embellished with agates. The inscription is written in mediæval Latin, and is enclosed in an incised border of a Celtic character. The work was entrusted to Messrs. Jones & Willis, of Birmingham and London.

THE Bilston Town Commissioners have appointed a subcommittee to consider the question of providing a new fire-engine and appliances.

IN another column we notice a few of several fires that have occurred during the present cold snap. With the improved appliances for heating, whether by use of coal, hot air or hot water, fires are, we fear, far more frequent than need be, and seem to imply that the precautions for safety have been neglected. It must be also remembered that in regard of fire-extinguishing appliances no one need be without an additional safeguard in case of fire.

WITH the present issue "Calvert's Mechanics' Almanack" reaches its nineteenth year of publication. It contains, in addition to the usual matter of an almanack, practical, technical and industrial information, especially instructive and entertaining to artisans and handicraftsmen and those generally engaged in mechanical, engineering and building and constructive trades, decorative, artistic, manufacturing and kindred operations; also original calendar notes, references relating to events, inventions, inventors and biography, &c.

THE "Railway Diary," by Messrs. McCorquodale & Co., Limited, is especially useful as a railway officials' directory, and, it may be added, to professional men and many of the general public, who often require unexpectedly the information which they could not otherwise obtain at the moment.

THE lighting of the Opera House, Covent Garden, for the forthcoming season of "Fancy Dress Balls" has been entrusted to the Wenham Co., Limited, by Sir Augustus Harris. The company are supplying the lamps for the outside lighting of Drury Lane Theatre during the pantomime.

THE following tenders have been accepted for work in connection with the new arcade and shops in Old Market, for the Halifax Corporation, in place of others withdrawn:—G. Townsend & Son, carpenter and joinerwork, 2,940*l.*; Birkby & Sons, Wyke, excavator, mason and bricklayerwork, 6,520*l.*

AT the meeting of the Featherstone Local Board a letter was read from Lord Masham intimating an offer to light North Featherstone for a term of fifteen to twenty years with electric light, or so long as the coal on the Ackton estate lasted and continued to be worked, for the sum of 20*l.* per year and 4*d.* per hour during the time the current was used. The offer was accepted.

AN extraordinary general meeting of the shareholders of the Gas Company has been held for the purpose of considering proposals for the extension of the gasworks. To provide the site for additional gas storage, &c., the directors have purchased two acres of land near the present works on the Newbold Road, and they propose to put there a double-lift holder, 100 feet in diameter, on the telescopic principle, at the estimated cost, with the necessary valves and connections, of about 7,000*l.* They propose also to enlarge the retort-house, to place therein retorts of the regenerating principle, and gradually to replace the present retorts with others of the regenerating kind.

CONTRACTS for the new Lancashire and Yorkshire Bank, in Commercial Street, Halifax, for which Messrs. Utley & Gray are the architects, have been let as follows:—Mason, &c., work, W. Sutcliffe, Sowerby Bridge; carpenter and joiner, S. Greenwood, Halifax; slater and plasterer, J. Bancroft & Sons, Halifax; and plumber, &c., J. Naylor & Son, Halifax.

AMERICAN NOTES.

THERE has been a great deal of criticism, *Stone* of Indianapolis says, on the pavement question in American newspapers. But in American cities it is universally the practice, as soon as a pavement is laid, to tear it up again for the laying of mains and pipes. There is no pavement that will withstand such treatment. No matter how secure the foundations, or how well the pavement be laid, nor of what material, it will be injured if not ruined by tearing it up in portions for street purposes. In

truth, the heavier the foundation and the better the work the more it will be injured by being torn up in sections. A scheme for street improvement should include not only improvements for the moment, but should anticipate the future. It is ruinous to spend good money for one improvement to ruin it by other improvements. A municipality should include the paving with the other improvements, and when a street is improved it should be perfected. As it goes in American cities we neither have the pavements, the improvements, nor the money they cost. They would cost less at beginning and would last five times longer, and while lasting would be five times better, if they were carried through on a definite plan. Sewers, gas and water mains, and electric conduits are as much a part of street improvements as pavements, and the improvement should include the whole or none.

THE *American Manufacturer* says in regard of iron ore that the famous Dickerson Mine, on Mine Hill, New Jersey, which has been one of the prolific mines of the State, and is certainly the oldest known within its borders, has suspended operations, the lessee having reached the conclusion that it could no longer be worked with profit. With it is closed the last of the various mines once operated on and about Mine Hill, and no regular mine is now being operated south of Irondale. The business of the Ferro Monte Railroad, which carried the ore from the Dickerson Mine to a spur of the Chester Railroad, is also closed. The Dickerson Mine was the oldest in the State, though it had not been the most productive. It was originally taken up as a mining tract in 1716. It is stated that ore from this mine was used during the war of the Revolution to make cannon balls for the Continental army, the ore so used being taken to what was known as the Tory Forge, at Andover, Sussex county, a forge which was owned by Tories, but was leased by the Continental authorities for this purpose. The ore was from the beginning of the best quality.

THE French Consul at Chicago has applied for 130,000 square feet of space in the exposition buildings, viz. in the manufacturers' building, 100,000 square feet; in the fine arts building, 20,000; in the machinery-hall, 10,000. Space will also be required in the mines and mining, agricultural and horticultural buildings.

THE Edge Moor Bridge Works, of Wilmington, Del., has been awarded the contract for the ironwork for the administration building of the Columbian exposition, the amount of the contract being 429,000 dollars.

VARIETIES.

AT the meeting of the Association of Birmingham Students of the Institution of Civil Engineers, held at the Midland Institute, the president, Mr. J. Edward Willcox, C.E., delivered a lecture on "Details of Plumbing Work."

THE Tasmanian Parliament has sanctioned the expenditure of 700,000*l.* on the construction of public works, and has also granted numerous concessions to syndicates to construct railways, tramways and electrical services for the new mineral country.

THE Glasgow Agricultural Society propose to erect a Scottish Agricultural Hall, which will be carried on on similar lines to the Royal Agricultural Hall at Islington. The suggestion was first made several years ago, and though plans were made, estimates got out and site selected, the project was abandoned.

THE Birmingham Art Gallery has been enriched in the permanent collection by a water-colour drawing by Dante Rossetti, entitled *Sir Galahad*, being the original design for the illustration in Moxon's edition of Tennyson's poems, and two beautiful pre-Raphaelite works, *The Annunciation* and *The Nativity*, by Mr. Arthur Hughes. The committee have also purchased two fine water-colour drawings by Peter De Wint and Mr. Alfred W. Hunt, R.W.S. The family of the late Mr. George Wallis, who many years ago was head-master of the Birmingham School of Art, have presented to the Museum a bronze bust of Mr. Wallis, by Mr. Albert Toft.

AT the meeting of the Southampton Town Council a letter from the borough surveyor, Mr. W. B. G. Bennett, was read stating that he wished to become a candidate for the office of chief surveyor to the vestry of St. Pancras.

IN restoring the chancel of Tarvin parish church the open timber roof dating from the Middle Ages, which had been hidden by a ceiling, was reopened. The works have been carried out under the direction of Messrs. Grayson & Ould, architects, Liverpool.

AT the general meeting of the Channel Tunnel Company, the engineer reported with reference to the trial borings for coal as follows:—"Since my last report announcing the discovery of a 2 feet 3 inch coal-seam we have bored through 196 feet of hard, grey, jointed sandstone, and have just proved another seam 2 feet 6 inches in thickness of good bright house

FROM THE LONDON AND SUBURBAN SANITARY SURVEY ASSOCIATION.

"Connaught Mansions, Victoria Street, Westminster, S.W.: April 24, 1890.

"I have now had one of your 'Grahtryx' Smoke-Test Machines in use some time, and find it exceedingly useful and reliable. I inspect several hundred houses annually, and in many of them I find something more than the ordinary smoke tube absolutely necessary, and your machine meets that want. It is, I consider, the most portable, compact, well-fitted, and perfect little machine in the market, and invaluable to all Sanitary Authorities, Engineers, Inspectors, and Plumbers. It should also be of great value to Nurserymen, Plant-growers, Florists, &c., as an exterminator of green fly and other pests. I have tested it in this way in my own vinery, conservatories, &c., and find it most efficient when used with tobacco paper. It should also be of great service to gamekeepers for the rabbit warrens, and for bolting rats. "EDWARD TIDMAN, C.E., M.S.A., and M.P.S.I., and A.S.M."

FROM THE GLASGOW SANITARY PROTECTION ASSOCIATION.

"In reply to your inquiry, I have to state that I have had the Smoke Machine in daily use for over six months (on about 200 different occasions), and have found it very satisfactory, both as regards efficiency and handiness. "GILBERT THOMSON, M.A., C.E."

BAIRD, THOMPSON & CO., *Ventilating, Sanitary, Heating and Consulting Engineers,*

[2] **165 QUEEN VICTORIA STREET, LONDON, E.C.; 24 BATH STREET, GLASGOW.**

coal at 1,810 feet from the surface. This makes the seventh workable seam of good bituminous coal found. The aggregate thickness of the seven seams may be taken at 14 feet 6 inches. The indications of deeper seams are still favourable."

AT a meeting of the committees having charge of the erection of statues to the memories of the late Thomas and Sir Peter Coats, of Paisley, for which over 4,000*l.* have been collected, held at Paisley, a letter was read from Mr. Dunn, M.P., offering two sites on the vacant space at Paisley Cross. The offer was accepted, and Mr. Dunn was thanked. A committee was appointed to obtain competitive designs.

WE regret to record the death of Mr. Edwin Thomas Howell, architect, of Southampton, on the 12th inst., aged eighty-seven years.

AT a conference on the subject of "The Disposal of the City's Refuse, Manchester," held in the Co-operative Hall, Ardwick, under the presidency of Dr. Arthur Ransome, the general opinion was in favour of the most objectionable forms of refuse being dealt with outside the city.

THE borough surveyorship of Luton has been resigned by Mr. J. E. Lovegrove, in consequence of his having been appointed borough surveyor to the Town Council of Richmond.

THE Dublin Trades Council have issued a report upon the necessity of concentrating public attention upon the advisability of consuming home-grown produce in preference to foreign, in order to divert unskilled labour from the towns to the agricultural districts. The Council propose organising conferences between representatives of the Irish and English working classes to consider the subject upon a mutual basis.

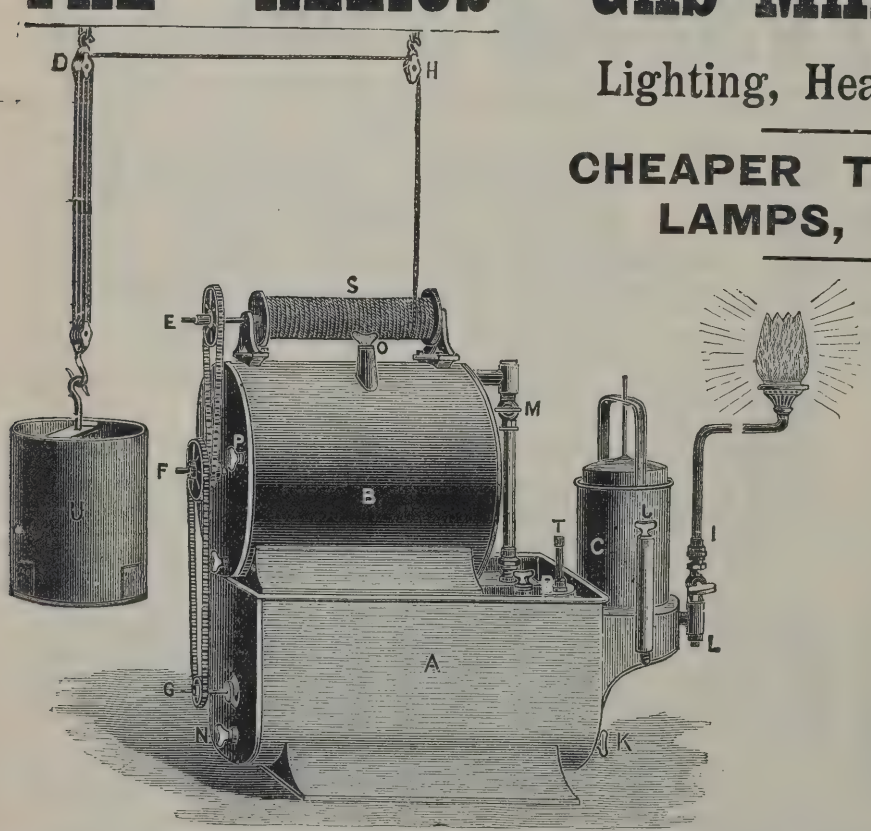
THE Society of Arts offer a gold medal, or 20*l.*, for the best invention having for its object the prevention or extinction of fires in theatres or other places of amusement. The competition is to close at the end of the year.

AT Stoke Prior, near Leominster, discovery has been made in a coppice by Mr. V. J. Godley, while digging to release a ferret, of silversmiths' work. The vessels, the *Birmingham Post* says, consist of a chalice, two cups, a paten and a beautifully-gilded and chased vessel, combining the paten, the water-holder, and a perforated vessel for incense; and those who have had the opportunity of seeing them naturally conclude that they have been used in the services of some Roman Catholic church. The hall-mark is upon each vessel. The chalice is the oldest vessel, its date being 1578–79; that of the sacramental cups is 1594–95, the large vessel standing upon three claws 1596–97 and the paten 1639–40. On three of the vessels there is a crest, the body of a fox on four legs and the initials "F.E.A." Early in the New Year a public inquiry will be held with reference to the discovery.

THE VICTORIA STATION.

THE London, Brighton and South Coast Railway Company have in view the enlargement of their Victoria Station, for which purpose it will be necessary for them to acquire, either compulsorily or by agreement, land lying between the station and the Buckingham Palace Road, and extending from Belgrave Road on the south to Wilton Road on the north. Parliamentary powers are also sought to enable the railway company to stop up that part of Wilton Road which lies between the Buckingham Palace Road and the western entrance to the station, substituting therefor an improvement of Wilton Road, which would comprise a new junction with the Buckingham Palace Road immediately to the northward of the site of the present junction, and also a widening of Wilton Road. It is further proposed to reconstruct what is known as the Elizabeth Road Bridge, which carries the St. George's Road over the Grosvenor Canal, and over the railways of the London, Brighton and South Coast and the London, Chatham and Dover Companies, and at the same time to widen the former company's railway, for which purpose it would be necessary to take the towing-path and part of the waterway of the Grosvenor Canal.

TOWN COUNCILLORS AND MUNICIPAL CONTRACTS.



AT a recent meeting of the Glasgow Town Council Mr. Cleland asked the following question:—Is it competent for the Town Council, as Water Commissioners, or in any other capacity, to enter into any contract or agreement for the executing of any work or the furnishing of any labour or materials with any individual member or members of Council, or with any firm or company of which such member or members of Council may be partners, directors, managing director or shareholder; and, further, does No. xx. of the standing orders of the Town Council, apart from the common law on the subject, disqualify or prevent any such individual member or members

THE "HELIOS" GAS-MAKING MACHINE

FOR

Lighting, Heating, and Motive Power.

CHEAPER THAN COAL GAS, OIL LAMPS, OR ELECTRICITY.

This Machine is the latest development of the Oil Gas systems. In most other such machines Gasoline is the gas-producing material, and as this can only be procured in large quantities, and is dangerous to store, there is naturally a great objection to its employment. The "Helios" Gas Machine is charged with Benzoline, which can be procured anywhere in large or small quantities. The Machine is simple, and the light produced far superior to coal gas. Machines made to supply from 6 to 2,000 lights.

Prices from £10 10s.

UNEQUALLED FOR

COUNTRY HOUSES, FACTORIES, HOTELS, &c.

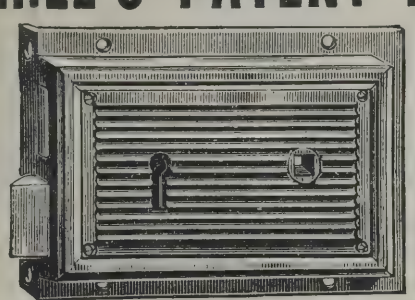
FOR FURTHER PARTICULARS APPLY TO

THE INCANDESCENT GAS LIGHT CO., LIM.

14 PALMER STREET, WESTMINSTER, LONDON.

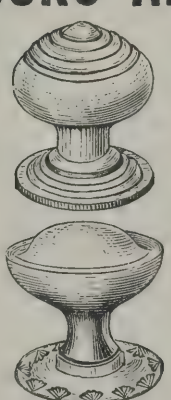
of Council from being in any way interested in or concerned with any such contract or agreement, even although he or they may be partner or shareholders merely of the firm or company with which such contract or agreement is proposed to be made?

The Town Clerk (Sir James Marwick) said:—The question now put to me is important, and requires a careful and detailed answer. The general law as to the illegality of persons in fiduciary positions entering into contracts with themselves for the execution of work from which they are to make profit is not doubtful, and I cannot state it more distinctly here than I had occasion to do in 1879 in a work which I then published on the "Law and Practice with regard to municipal elections in Scotland." The magistrates and councillors of royal and Parliamentary burghs and burghs of regality and barony, and the commissioners of police in burghs and places which have adopted the General Police Act of 1850 or 1862 are public trustees, and, as such, are subject to the liabilities, responsibilities and disabilities imposed at common law upon trustees and persons in fiduciary positions. They are bound in Scotland, as in England, to maintain a position of absolute disinterestedness, and to enter into no transaction in which their own personal interest may conflict or come into competition with that of the estate under their administration. They cannot therefore in their fiduciary character legally enter into contracts or transactions with themselves as individuals. So absolute is this rule that the Court will allow no investigation into the fairness or unfairness of the transaction. It will be held to be enough that the parties interested object. "It is a rule of universal application," said Lord Chancellor Cranworth, "that no one having such (fiduciary) duties to discharge shall be allowed to enter into engagements in which he has or can have a personal interest, conflicting, or which may possibly conflict, with the interests of those whom he is bound to protect." Mr. M'Laren, now Lord M'Laren, still further questions the statement. Hence we deduce the more general rule that trustees are under a disqualification from entering into any personal transactions with the trust. While such is the rule at common law, various general Acts contain provisions on the subject, which are frequently incorporated with local Acts. In some cases also local Acts contain special provisions which carry the principle further than the common law does. But it appears to me to be clear that the principle of the law of Scotland, as well as that of England, which has been adopted from the civil law, applies to all persons in any fiduciary capacity. There seems no room for doubt, therefore, that no councillor can make profit out of any work done by him as an individual for the Council of which he is a member or for any of the trusts under its administration. It will be for the Council, having regard to the interests both of the Corporation and of its contractors, to determine what action should now be taken in regard to this matter. In view of its importance, I think the opinion of counsel should be taken upon it.

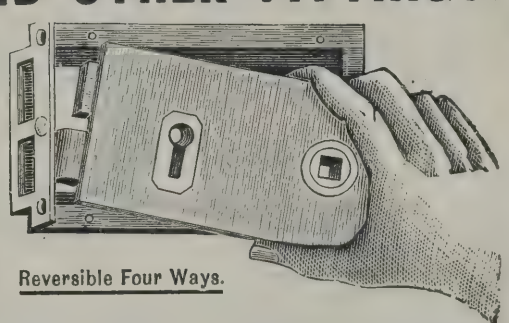


Mr. Stark begged to move that the Council take the opinion of counsel, as suggested by Sir James Marwick.

It was after a consideration agreed to delay the subject till next meeting, and that in the meantime the opinion of Sir James Marwick should be printed and circulated amongst the members.



THE ALEXANDRA PALACE.



AT the last meeting of the Middlesex County Council, Mr. Littler, Q.C., the chairman, who had drawn up a lengthy scheme for the acquisition of the Palace and Park, moved that the matter be referred to the Parliamentary Committee, as a Bill was being prepared by the owners of the Palace and Park for the sale of the estate. This was also agreed to. The scheme prepared by the Chairman stated that the Financial Association, who owned the Palace and grounds, were prepared to sell the whole of the 414 acres to the Council for 275,000*l.* There were besides 28 acres of leasehold land, and the purchase of that would cost about 16,800*l.* He suggested that the partitions in the building should all be removed, and the Palace should be thrown open from end to end, that a number of semi-hardy trees, &c., should be placed in the building to form a public covered promenade. The amount required for the purpose of buying the buildings and grounds would be about 300,000*l.*, which he proposed should be raised. The London County Council might give 100,000*l.*, the Corporation of London 40,000*l.*, the Middlesex County Council 15,000*l.*, and the local authorities the remainder, 145,000*l.*, and he thought the railway companies would subscribe on the principle of giving to seaside piers. The Great Northern Railway would construct a new railway from Wood Green Station into the Palace. Practically the whole of the buildings, save on certain days, and with the exception of the theatre and concert-rooms, should be absolutely free to the public. Portions of the grounds should be devoted to games of every kind. Good music should be provided in the fine weather in the open air, and in bad weather in the Palace, together with organ recitals, &c.; and, lastly,

HILL'S PATENT LOCKS AND OTHER FITTINGS.

All kinds of Rim and Mortice Locks, Door Furniture, Sash and Casement Fittings, Swing-door Hinges, &c., kept in Stock. (1)

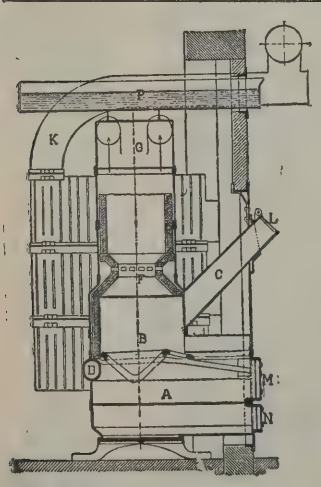
accommodation might be given on excepted days and in special spots for horticultural, industrial and other shows. The proposal goes on to say:—"A very important feature is the preservation of the grounds, as the open space relates to the national defence, the hill commanding the Lea Valley and the Northern and Eastern Railways and also the New River, and in case of invasion would be invaluable for the protection of London. The maintenance of the Palace and Park should be upon equitable terms, arranged between the various authorities who will contribute to the purchase. Some small strips of land around the Palace and Park could be used for building purposes, and would bring in about 2,100*l.* a year. A source of income might be derived from refreshment contractors—say 5,000*l.* per annum; from the letting of stalls, 1,200*l.* a year, and from the theatre and concert-rooms 1,000*l.* a year. The expenses he would put down at 7,900*l.* a year, and the receipts above estimated 9,200*l.*"

The Parliamentary Committee were instructed to consider the matter and report at an early date.

PRIVATE BILLS FOR NEW WORKS.

THE last day for the deposit of private Bills at the Private Bill Office of the House of Commons is December 21. Plans, sections and books of reference have to be deposited on November 30, but notice has also been given of several Bills in respect of which no plans, &c., are required to be deposited. Among the Bills of local and general interest for the coming session are the following:—Alexandra Palace and Grounds, Baker Street and Waterloo Railway, Bedford and Grand Junction Canal, Central London Railway, City and South London Railway (Islington Extension), Channel Tunnel (Experimental Works), Borough Market, Southwark, Corporation of London (Stamps and Loans), East and West India Dock Company, East Indian Railway Company, Epsom Downs Extension Railway, Great Northern and City Railway, Hampstead, St. Pancras and Charing Cross Railway, Imperial Life Assurance, Lea Valley Drainage, London, Brighton and South Coast Railway (Various Powers), London, Chatham and Dover Railway, London County Council (General Powers), Subways and Tramways, London, Tottenham and Epping Forest Railway, London Tramways (Extensions), London Water (two Bills), Manchester, Sheffield and Lincolnshire (Extension to London), Manchester Ship Canal, Metropolitan Railway, Midland Railway, National Penny Bank (Limited), National Telephone Company, New Telephone Company (Limited), North British and Mercantile Insurance Company, North Metropolitan Tramways, Railway Passengers' Assurance Company, Regent's Canal, City and Docks Railway, Royal Bank of Scotland, Officers' Widows Fund, Royal Exchange and Waterloo Railway, St. Pancras Vestry, South-Eastern Railway, Southend Gas, Southend Marine Lake, Union Society and Union Life Office, Ward Electrical Car Company (Limited), Waterloo and City Railway, and Westminster (Parliament Street, &c.) Improvements.



THE SANITARY CONDITION OF FLORENCE.

THE report on the sanitary condition of Florence made to the Sindaco of the city by Sir Douglas Dalton, K.C.B., begins with a general description of Florence so far as relates to its sanitary condition, showing, *inter alia*, as regards rainfall that it is subject in summer to occasional torrential storms. It describes the various sanitary improvements of the last twenty years, namely, the abolition of slaughter-houses in the town, the new water-supply, the new drainage, the removal of insanitary dwellings, and the effect of these on the death-rate, which was reduced from an average of nearly 36 per 1,000 in 1873 to 25 per 1,000 in 1890, although in that year the typhoid epidemic developed itself. The report then proceeds to describe the water-supply and the drainage, the new building laws, the scavenging and removal of refuse.

To the contamination of the water the typhoid epidemic was somewhat hastily attributed. Formerly all houses had their wells, which are from 25 feet to 40 feet deep, into the beds of gravel, sand and clay which underlie the bed of the Arno, and on which the city stands. The cesspits were originally also excavated out of these strata, and although lined with brickwork and cement and made more or less impermeable, yet the water of many wells has been contaminated. There are two sources of extraneous supply—one from the Monte Reggi, from the gravel and sand beds, in which the river Mugnone runs (a tributary of the Arno), which was originally provided by the Medici, and supplied the Pitti Palace and other places on its way. This was extended about twenty years ago by one of the family of the Canta-Galli at his own expense. It is delivered by gravitation into a reservoir 60 mètres above the level of the quay at Florence, but since its extension it has occasionally become turbid in times of much rain. Last

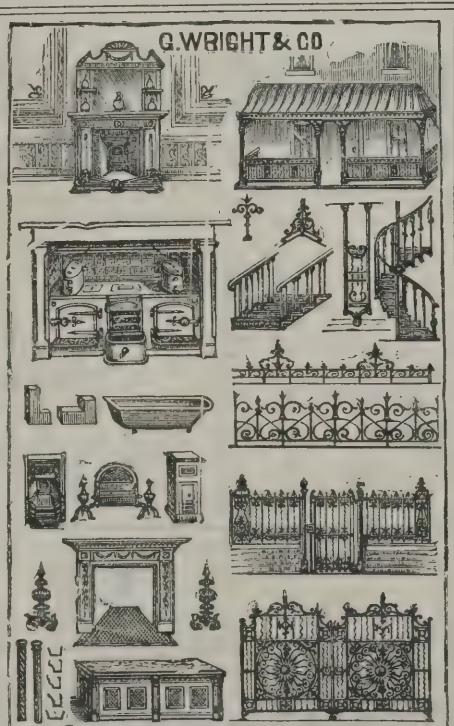
year it was alleged that the contamination of this source had caused the typhoid epidemic, and it was cut off. The analysis of the water made at the time did not bear out this contention. The other extraneous source of supply was constructed between 1873 and 1876. It consists of two galleries carried at a depth of some 12 feet or 14 feet below the bottom of the Arno. They start from the waterworks, which are situated on the quay on the south side of the river near the Via dei Bardi. One is carried under the river-bed to the opposite side, and receives water from a well situated near the Campo di Marte. The other is carried up the valley parallel to and about 70 mètres distant from the river. Both are in the gravels and sands in which the river-bed is situated. The galleries are of masonry; water is admitted through openings in the bottom and through holes in the sides, the latter at distances of about 5 feet apart and 2 feet from the bottom. The part of the gallery which passes under the town has been recently made impermeable, and water is now collected only from that part, 60 mètres in length, which lies under open fields above Florence. The water is pumped out by turbines driven by the water of the Arno into three reservoirs, at heights of 60 and 40 mètres above the level of the quay, and thence distributed by gravitation. These reservoirs are capable of holding 36,000 cubic mètres. This water is always clear and good. The quantity may be said to vary from 5,000 to 10,000 cubic mètres in the twenty-four hours, according to the season. At the present time out of 12,000 houses in Florence about 3,200 receive the town supply, and there are, moreover, 180 public fountains or stand pipes. It is proposed to extend the gallery up the valley from 300 to 400 mètres, according as may be necessary to bring up the supply to the present required quantity of about 24,000 cubic mètres a day, and to protect the surface in the vicinity from any pollution for a considerable distance. The Municipality have recently bought springs in the mountains near Lucca, which can supply 60,000 cubic mètres in twenty-four hours at a high level, but these springs are 70 miles from Florence, and it will require some three years at least to bring the water into the town. Meanwhile the gallery, when extended, will supply all that is required.

The drainage was designed partly to prevent the flooding of the town in times when the Arno was running full. A committee laid down in 1873 the system of drainage to be adopted and the conditions to be observed in carrying it out.



1. The drains were to receive rainfall.
2. The drains were to carry off the refuse house-waters; the cesspits were to be reduced in size by the adoption of portable barrels, called *asportabili*, with overflow for the liquid matter, which was to be passed into the drains, the solid matter being retained and removed periodically.
3. They were to be of a size to be accessible to all parts, but the bottom was to be provided with a cunette of circular section to carry off the limited flow of house-water.
4. The communication between the big street drain and the houses was to be by means of square lateral drains laid close to the houses, of a section of about 18 by 24, with covered galleries of communication at every 60 or 70 mètres leading from the side drain into the main drain. These lateral drains were not to receive the waters directly, but pipes were to be laid in them from the houses, one pipe being laid to bring the house water, and another pipe to bring the overflow from the *asportabili*, which was to be carried down to deliver under water. When cesspits were retained there was to be no overflow from them into the drains.

Of these drains about one-half have been completed, but except in general section they have not adhered uniformly to the type laid down. The cunette has often been made rectangular instead of circular, which therefore favours deposit. The pipes of communication in the lateral drain have not been generally adopted. Outside the Viales, where drains have been constructed, a different pattern has been adopted, which is also large enough to pass through, but these drains have an almost flat bottom made the full width of the drain, which is well calculated to promote deposit. There is no ventilation for the drains except the street gullies, when not trapped, and the house drains which have no intercepting arrangements. About one-half the town has been laid with these drains as approved by the Commission of 1873, but as already mentioned, the rules laid down by them were not strictly adhered to. The old-fashioned drains in the rest of the town are rectangular, about 2 feet by 1 foot 6 inches in section, and about 3 feet to 4 feet under ground, generally leaky with deposit.

The recent building regulations for new houses contain some good points, especially as to height of houses in relation to width of streets and as to light and air to the backs of houses, and they require that all latrines should have direct access to light and air. Cesspits are to be impermeable. As a rule the fæcal matter is retained in cesspits, generally under the houses, sometimes under the courtyards. The *asportabili*, which, as already mentioned, consists of a small barrel with a grating at one side, which allows the liquid to escape into the

drains, has been adopted in by from 12 to 15 per cent. of the houses. It is unnecessary to say that this liquid is in a highly putrescible condition, and as the drains are not free from deposit causes nuisances in summer and is always dangerous.

There are about 11,000 cesspits under the houses in Florence, which contain at a low computation on an average 10 cubic mètres each of fæcal matter. These cesspits in some cases have not impermeable sides, and even when the sides are cemented the arch is not cemented, and undoubtedly the gases pass up through the brickwork into the house. They are emptied by the aspirating process. If the material is rich, they are emptied for nothing. When much water is used, it costs about 1 fr. per cubic mètre. In the case of several houses examined it was found that to avoid the frequent emptying of the cesspit an overflow had been arranged either into the house-drain or the street-drain. Of the *asportabili* there are from 1,500 to 2,000 in use, which are changed, some once a week, some once a month, some more seldom. The price varies similarly, according to value of contents, up to 22 frs. annually.

A consideration of the circumstances attending the epidemic of typhoid of 1890-91 affords the best measure of the sanitary state of the town. A considerable amount of typhoid fever had occurred during the autumn in the country round Florence, and at Prato about 200 deaths had occurred in November. The total number of cases of typhoid fever which occurred from the end of November 1890 to March 1,891 was 1551, of which 326 cases were military cases in the barracks, which leaves 1,225 civilian cases. Of the military 16 and of the civilians 23 died. The epidemic centred itself chiefly in four localities, and a detailed examination of these was therefore made.

These localities were—(1) The barracks of Belvedere and San Giorgio, and the streets extending thence to the Maggio and the Ponte Vecchio; (2) the part extending thence up the Via Romana; (3) the district between the Mercato Movo, the Piazza Signoria and the Por San Maria; (4) the locality near the Via Faentini and thence to Viale Vittoria Regina.

A detailed inspection was made of almost every house in these several localities. Of the houses in which cases occurred about one-third had water laid on from the town supply. The other two-thirds were supplied by wells, but, of course, to these latter the public fountains were accessible. These four centres of the development of the disease were all situated in parts of the town where either the old square drains were in use, except in the case of the Viale Vittoria Regina, where the inclination of the drain has favoured deposits. These drains all contained more or less deposit.

The simplest way to elucidate the spread of the disease in these localities will be to take two examples. The chief outbreak occurred in the barracks of Belvedere and San Giorgio, which are in close connection with one another. The troops had made frequent marches into the country during November and into localities where typhoid fever was prevailing. The first cases among the soldiers occurred early in December. In Belvedere Barracks, out of a garrison of 318 there were 117 struck with fever, and in San Giorgio, out of a garrison of 450, 107 were laid up. The men when first taken ill were kept under observation in the barrack infirmary before being sent to the general hospital. In the infirmary their evacuations, not disinfected, went into an *asportabili*, which had an overflow into the barrack-drain. The barrack-drain was of the square flat type, full of deposit, often covered only with flat stones, and it meandered through the barrack under some buildings, and close to wells not entirely disused, through courtyards with openings at intervals for waste water, until it joined the street-drain without any intercepting trap or other arrangement. The street-drain of similar pattern was leaky and full of deposit. It passed through the street and was joined by the house-drains without interception. Into these latter the waste-pipes from sinks and gullies emptied untrapped, and the street-drain, and frequently the house-drain, received the overflow from the *asportabili* and sometimes from the cesspit. The drains thus afforded a convenient passage for the exhalations from the main drain throughout the houses. If there was town water laid on the supply was intermittent, and the sink waste-pipes passed directly into the drains, and had no trap, so that the exhalations from the drains could be easily drawn into the pipes. In the houses the pipe from the cesspit or *asportabili* was led straight up to receive the connections from the latrine on each successive storey, and this pipe afforded the only ventilation to the cesspit. The latrine generally opened directly out of a bedroom, or a kitchen, or a living room, or was close to them. Often it had no opening of any sort, except into the room, and this formed the only ventilation for the cesspit.

One instance will suffice to exemplify the facility with which the fever could be spread under these conditions. There was a house in the Via Vachenegia which had two cesspits, one of which had an overflow into a drain which passed through the back of the house into the Chiasso del Bucco, and thence through the Via Lambertesca into Por San Maria. There were

KALLKOLITH.

NEW PATENT PRIMING AND STAIN.

Acknowledged by experts of nearly every country to be one of the most important inventions of the Nineteenth Century.

PATENTED IN England, Belgium, France, Germany, Italy.

REGISTERED

TRADE MARK.

PATENTED IN Austria-Hungary, Denmark, United States of America.

KALLKOLITH is one of the most marvellous inventions of the present age, and is used as a priming in place of the now almost obsolete oil-colour. It produces an exquisite smoothness, combined with great durability, and amalgamates thoroughly with wood, iron, cement, stone, plastering, &c.

CHEAPNESS.—It saves at least 100 per cent. in comparison with any other priming now in use, being less than half the weight.

ECONOMY is manifested by the fact that one 14-lb. tin of **KALLKOLITH** goes further than three times the same quantity of oil-colour.

DRYING POWERS.—It dries within one to two hours, thereby greatly facilitating the quick dispatch of labour.

DURABILITY.—Where **KALLKOLITH** is used it imparts an amount of durability to all oil-colours used upon it which has never yet been obtained, and one of the most important advantages in its use is that the paint put upon it does not blister.

PAPER-HANGING.—Walls prepared with **KALLKOLITH**, thinned with seven parts of water, give a great additional advantage to the hanging of all descriptions of papers.

TESTIMONIALS.

21 New Bridge Street, London, E.C.: February 28, 1886.

I have had some trials made with the KALLKOLITH during the past few weeks, the results of which are very satisfactory. The KALLKOLITH is to be used as the first coat of paint on wood and other substances, and is of such a nature that the ordinary work in preparing for paint is considerably lessened, and the usual number of given coats now reduced, and, once fairly introduced in the market, I am certain there will be a large sale. J. WM. STEVENS, Architect and Surveyor.

75 Newman Street, Oxford Street, W.: Feb. 15, 1887.

We are pleased to tell you that the KALLKOLITH supplied to us has been fairly tried, and we find that it answers all that you claim for it.

CAMPBELL, SMITH & CO.

Price per case of 8 Tins of 14 lbs. each, net 40s., packing included. Special terms to Wholesale Buyers and Shippers.

Address—KALLKOLITH CO., 175 STRAND, LONDON, W.C.

en cases of typhoid in the part of the house whose latrines otied into the cesspit which had the overflow. No cases urred in the apartments which used the other cesspit. ere were four cases in two of the houses in Chiasso del co whose sinks communicated with the drain. Six cases urred in Via Lambertesca and seven cases in Por San Maria, in houses communicating with the drain—twenty-four cases all. This is only one of many instances.

The recommendations resolve themselves into—

1. Closing all the wells and developing the present water pply, because this can be done at once at no great expense extending the existing gallery. It is clearly better to lise at once that which is a good supply, and to allow the ieme for bringing in an ideal water supply from the untains to stand over until the more pressing want of nodelling the drainage system is completed.

2. To spend all available money in completing a drainage stem by which the large mass of fæcal matter (at least 0,000 cubic mètres) now lying under Florence should be moved and carried away by drains to be applied to irrigation, her by utilising and extending the present system with difications to adapt it to modern experience or else to adopt eparation system. The report leaves this question an open e until a plan of the actual condition of the present drains s been made, so as to enable an accurate estimate of cost of her arrangement to be made.

3. Thorough and immediate revision of the house drains, iich are almost invariably square in section, flat-bottomed and nerally leaky, including interception from street drains and her obvious suggestions.

4. The extension of the present system of sanitary inspection include all the sanitary conditions of houses.

5. Until the town drains have been revised stringent regulaons should be adopted to prevent overflows from cesspits or *portabili* into the drains. That instead of the wooden *portabili* a metal one should be substituted without overflow, the principles of the French *tinette*.

That the existing rules as to impermeability of cesspits be rongly enforced; that cesspits should be ventilated independently of the pipes of the latrine; that all latrines should be osed which had not direct access to light and air, or which pen directly into living rooms.

In conclusion, the report observes that the epidemic on this ccasion was limited to those parts of the town in which there ere obvious sanitary defects. And as an evidence of the gradual improvement of health in Florence, it mentions that an epidemic of typhoid in Florence which occurred about twenty-one years ago carried off 914 victims, or at the rate of 5 per 1,000 of the then population.

The epidemic of last year carried off 234 victims, or 1·2 of the population. The death-rate, which was nearly 36 per 1,000 twenty years ago, has been gradually diminishing. It averaged 32·9 per 1,000 for the six years from 1877 to 1883, and 26·8 per 1,000 for the seven years 1883 to 1890; and in 1890, notwithstanding the typhoid epidemic in December, it was 25·1 per 1,000. But undoubtedly typhoid still lingers in Florence; in the six months of May to November 1891 there occurred 45 deaths in the city, of which 12 deaths occurred in November. Therefore, however much Florence may have improved its health conditions in late years, all persons interested in its progress must hope that it will complete its efforts in sanitation by an early and thorough revision of its drainage system, and thus become one of the most healthy, as it is one of the most beautiful, cities in the world.

PUBLIC FOUNTAIN IN MEMORY OF LATE R. F. O. FARQUHARSON OF HAUGHTON.

A SHORT time after Mr. Farquharson's death, which occurred in the spring of 1890, a strong desire was expressed by his friends and neighbours that a public memorial should be erected to his memory. A committee was appointed, and had under inspection several designs, from which they unanimously selected a design presented by Mr. Alex. Hogg, surveyor, Alford, the principal elevation of which we have produced. The whole structure is composed of granite finely dressed, several parts of which are polished. Besides being a substantial structure, the fountain will be a great convenience, and will form a special feature in the village, situated as it is at the point of a triangular piece of ground in front of the Haughton Arms Hotel, near the market stance, and where several roads meet the principal thoroughfare. The principal elevation looks down the village, and the monument can be seen with advantage from all sides.

Around the site of the structure the approaches are neatly pitched with "setts" having proper falls and escapes for surface-water. The plan is square, and the ground design has a Norman character. The pedestal is erected on a daïs approached by steps, the blunting of the front corners of which give it an

P. A. GILBERT WOOD,
175 STRAND, LONDON, W.C.

octagonal appearance. At these corners are placed troughs for cattle and horses. At the angles of the centre-piece are diminishing buttress stones, the top of which is coped by the basin table which has splayed projection and polished top. There are basins on the north, south and east sides, polished inside with brass gratings. The whole of this part is made of native Sylavethy granite finely axed.

On the centre, between the three basins, is erected a neatly-designed delivery urn of polished Peterhead granite, the water

from which rushes out from devices of cast bronze lions' heads into the basins, and from thence flows through the buttress into the troughs. At the west side is constructed a self-shutting tap for drawing water into pails for household or other general purposes. Springing from the basin-level at each corner and alongside the urn are four columns, having bases and capitals of Sylavethy granite, while the shafts are of polished Peterhead granite. On the tops of these is surmounted a massive block of Sylavethy stone, cut with richly-moulded arches, forming a groin arch above the centre of the urn; immediately above this is the cornice, the frieze of which is of polished Peterhe granite, filled in with an incision of ivy foliage.

From the top of the cornice, the structure diminish towards the finial in a spirelet form, from the sloping sides which are constructed the inscription panels. These panels a encased on each side with Peterhead polished granite colum On the east panel is the "Haughton crest," cut in *alto rilie* the centre figure of which is a circular human face, represent the rising sun emerging above a cloud, the radiations of wh are polished. On the lower end of the panel are two reclini twigs of Scotch fir, which is the badge of the Haught Farquharsons. Over the top of the radiation is the wo "Illumino," cut in raised letters, in a raised band terminating ribbon dangles, while on the key of the arch above is cut t deceased gentleman's monogram, in raised letters, gracefu entwined. The panels are of polished Corennie granite, wi gilded edges. The north panel contains the following inscri tion in gilded letters.

This fountain is a testimony of respect and regard
To the memory of
ROBERT FRANCIS OGILVY FARQUHARSON,
Esquire of Haughton,
Who died May 3, in his 67th year.

On the south panel is a further inscription, viz.:—

Erected by his tenantry, feuars and friends, as a token of the estee and affection in which he was held, for the active and generous intere he took for many years in promoting the prosperity of his native vale

While on the east panel are the words—

Built in 1891.

On the top of the panels is a moulded pediment with intrica cuttings, which also continues the formation of the spirele The railing mouldings instead of meeting at the apex a returned inward to the main surface, leaving neatly forme cavities, into each of which is inserted a moulded finale tippe with a polished red granite ball. The surfaces above the ped ment are formed with sunk panellings. The shank of the mai finale is octagonal, richly moulded, having a large spheric ball of polished Peterhead granite, with moulded band roun centre surmounted with a neat terminal. The entire height i 18 feet.

The contractor for the granite work is the firm of Messr James Wright & Sons, Royal Granite Works, Aberdeen, wh are now proceeding with the erection at Alford.

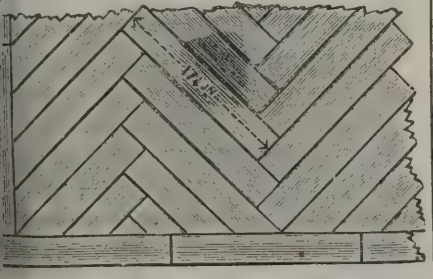
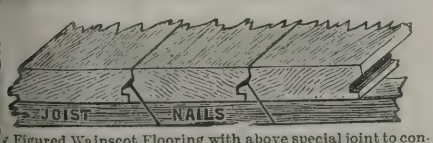
REGISTRATION OF PLUMBERS.



ANOTHER examination of candidates for registration by the Worshipful Company of Plumbers has been held at the Finsbury Institute. There was a very large attendance of applicants from Northamptonshire, Oxfordshire, Norfolk, Shropshire, Hampshire, Cambridgeshire and Suffolk, as well as from various parts of London and the home counties. The examination, while not being unduly severe, was such as to thoroughly test the knowledge of the applicants in the theory and practice of sanitary plumbing. The examiners were Messrs. C. Hudson, C. T. Millis, J. C. Ashdown, G. Taylor, W. B. Davis and L. F. Gilbert, the last representing the United Operative Plumbers' Association of Great Britain and Ireland. Exactly half of the candidates succeeded in passing the full examinations.



A meeting of the members of the Hull District Council for the National Registration of Plumbers was held in the Mechanics' Institute, Hull, on the 9th inst., the president (Alderman Sherburn, J.P.) in the chair. Amongst those present were Mr. W. R. E. Coles (secretary to the Worshipful Company of Plumbers, London), Alderman Fraser, Councillor Holder, the Rev. Dr. Lambert, Dr. Mason (medical officer of health), Messrs. R. H. B. Nicholson, F. S. Brodrick, J. Bilson, J. Whitfield, F. Wells, R.P., Buckle, R.P., Kenningham, R.P., Hirst, R.P., Hodgson, R.P., Storey, R.P., Harrison, R.P., C. W. Livington (inspector of nuisances), and J. B. Chapman (hon. secretary). The Chairman said he sincerely trusted that the Council would press on with a fixed determination—primarily, to watch over the inhabitants of the town and district, and, secondly, to raise to the very highest level everything connected with the plumbing trade. Dr. Lambert said they would probably know there was a considerable sum of money in the hands of the Corporation for the promotion of technical education, but they (the members of the School Board) had not yet been able to persuade the Corporation that they could make a good use of any of it. Mr. Coles said that the chief object he had in visiting Hull was to intimate that his company were desirous of co-operating with the Council, so far as possible, in the carrying out of plumbing classes in the most efficient way the Council could suggest. The London company were prepared to provide one-half of the amount, if the master plumbers and other members of the craft in Hull would provide the other half. He thought that if the local masters contributed, it would secure a greater local interest in such classes. In the proposed council, enacted in the Bill to be put before Parliament next year, it was intended that all existing organisations, along with some of the medical and educational bodies whose co-operation would be helpful, should co-operate for the carrying forward of the movement. The chief function of such a council would be to determine the qualification which should be imposed from time to time upon the plumbers registered under the system; secondly, they would have to hold, when necessary, inquiries into charges that might be made against a registered plumber. Other gentlemen having spoken, Mr. Wells moved the following resolution:—"That this meeting of master and operative plumbers, sanitary authorities, architects and others of Hull and district, desire to record its opinion that the time has now arrived when it is essential to the protection and preservation of the public health that the system of registration of plumbers which has been established by the Worshipful Company of Plumbers, with the co-operation of various local representatives of the plumbers' craft and the sanitary authorities, should receive the statutory powers which are necessary to secure the efficiency of the system." Mr. Hirst having seconded this, it was carried unanimously. Copies of the foregoing resolution were ordered to be sent to the borough and county Members of Parliament and the Worshipful Company of Plumbers.

A lecture on "Sanitary Plumbing" has been given at the Town Hall, Swansea, under the auspices of the District Council for the National Registration of Plumbers, by Mr. Perry, R.P.C., secretary to the Bristol District Council, and teacher of the plumbing classes at Bristol. The Mayor, Mr. Alderman Mason, occupied the chair, and among those present were Messrs. W. R. E. Coles, clerk to the Worshipful Company of Plumbers, London; G. Bell, borough surveyor, Dr. Davies, medical officer of health; Dr. Morgan, chairman of the School Board; T. P. Martin, architect and chairman of District Council: Councillor W. H. Spring; S. Reid, the secretary of the District Council; and a good attendance of masters and operative plumbers of the district. The Mayor, in introducing the lecturer, spoke favourably of the registration movement and its objects, and he then called upon Mr. Perry, who went fully into the question of sanitary plumbing, and explained by means of diagrams many of the mistakes commonly met with, which, had the plumber been properly trained, would never have occurred, and many lives would have been saved. To avoid these mistakes technical classes are held in many towns,

including Swansea, with great success in all cases. Mr. Perry showed the audience, by the use of a glass model, the necessity of ventilating all soil-pipes in houses. This model was in every respect a very interesting and remarkable piece of work. Several questions were then asked by plumbers present, which were answered by Mr. Perry. Mr. Coles said he was very pleased to see that classes were commencing at Swansea for the higher training of plumbers, and he hoped that in the next session of Parliament powers would be obtained to protect the plumbing trade. Dr. Morgan asked on behalf of the plumbers present for copies of the diagrams which had been shown, and expressed his great admiration of Mr. Perry's model. The Mayor, after the close of the meeting, promised to present some books on sanitary plumbing for the use of the Swansea plumbers, hoping that it would be the nucleus of a plumbers library in this town.

At Gordon's College, Aberdeen, Dr. Farquharson, M.P., presented the prizes awarded by the Worshipful Company of Plumbers, London, upon the recommendation of the judges appointed by the District Council for Aberdeenshire, Kincardineshire and Banffshire, in connection with the National Registration of Plumbers. There was a large attendance of the trade. Dr. Matthew Hay (Aberdeen University), president of the District Council, presided, and along with him on the platform there were, besides Dr. Farquharson, Mr. Esslemont, M.P.; Mr. Coles, secretary of the Worshipful Company of Plumbers, London; Mr. Wilson, architect; Mr. Simpson, teacher; and Mr. A. M. Byres, C.A., hon. secretary. Dr. Matthew Hay, in introducing Dr. Farquharson, made allusion to the assistance which had been given to the work by the governors of Gordon's College in providing accommodation for the practical class, and expressed his pleasure in seeing that, although there were to be certain changes, they would still be accommodated. They were trying, in a small way it was true, to create a school of technical education in Aberdeen, and so far they had profited by their labours. Not only had the Worshipful Company of Plumbers in London provided them with those beautiful prizes, but they had promised to make a contribution towards the cost of the classes. Dr. Farquharson then presented the prizes, after which he said that though that was his first appearance before a company of Aberdeen plumbers, he thought it was rather appropriate, because he was a plumber himself, though not in their sense of the word, and he would hardly like to have the responsibility of having to make good a defective pipe or drain, or such like. He had, however, had the honour of being elected into the Worshipful Company of London Plumbers, and he had the further honour of holding a seat in the court of that body. He was bound to say he congratulated the prize-winners, but he had never brought himself to commiserate those who had not succeeded, because he thought that they learned a good deal in the attempt. They had passed through an examination, and they were now able to take stock of their knowledge. He was never a prize-getter, but he was occasionally a prize-tryer, and he was sure he was none the worse for having tried to get them. He would say that the subjects in which he competed for prizes were those which he found were most deeply engraven on his memory, and were still subjects of greater interest to him than any of those subjects in which he had never tried to get prizes at all. He then went on to refer to the system of registration of the Worshipful Company of Plumbers. The system was not so complete as they would like, because powers had not yet been obtained to take legal proceedings against those who unjustly and illegally assumed the title "Registered Plumber." The object was not to make it compulsory on every one to become registered before being allowed to exercise the plumbers' craft. What was wanted was to give a certain qualification to plumbers which might be known by the public, the assumption of which unjustly might be made matter of legal comment and legal punishment, which he considered was only right and proper. To do something in Parliament from the hygienic point of view had always been his ideal in political life. On this occasion, being a plumber and a member of a scientific profession, he had felt it a duty, as well as a pleasure, to come there and say these few words in hearty congratulation of their earnest endeavours to do the best for themselves in the profession which they had chosen. Their work was of the highest importance, and from a hygienic point of view was becoming daily more so. County Councils had sanitary departments, medical officers of health, and sanitary inspectors in town and country, and they were working up to a very high standard. Plumbers' work would become much more extensive in the future, but it could not become more responsible. Under our modern system of drainage every house has been turned into a great reservoir, and if anything were wrong with the pipes and drains, fevers and other terrible calamities, which are included under the all-embracing name bacillus, ensued. To them was handed over the duty of keeping this terrible scourge out of their houses. Their work was not one that was seen, as was that of the architect. Very much of it was done under-
